Beyond Finite Layer Neural Networks: Bridging Deep Architectures and Numerical Differential Equations

Yiping Lu¹ Aoxiao Zhong² Quanzheng Li^{2,3,4} Bin Dong^{5,6,4}

Abstract

Deep neural networks have become the state-of-the-art models in numerous machine learning tasks. However, general guidance to network architecture design is still missing. In our work, we bridge deep neural network design with numerical differential equations. We show that many effective networks, such as ResNet, PolyNet, FractalNet and RevNet, can be interpreted as different numerical discretizations of differential equations. This finding brings us a brand new perspective on the design of effective deep architectures. We can take advantage of the rich knowledge in numerical analysis to guide us in de-

s while maintaining a similar performance. This can be explained mathematically using the concept of modified equation from numerical analysis. Last but not least, we also establish a connection between stochastic control and noise injection in the training process which helps to improve generalization of the networks. Furthermore, by relating stochastic training strategy with stochastic dynamic system, we can easily apply stochastic training to the networks with the LM-architecture. As an example, we introduced stochastic depth to LM-ResNet and achieve significant improvement over the original LM-ResNet on CIFAR10.

Machine Learning For Elliptic PDEs: Fast Rate Generalization Bound, Neural Scaling Law and Minimax Optimality

Yiping Lu*, Haoxuan Chen[†], Jianfeng Lu [‡], Lexing Ying[§], and Jose Blanchet [¶]

Abstract. In this paper, we study the statistical limits of deep learning techniques for solving elliptic partial differential equations (PDEs) from random samples using the Deep Ritz Method (DRM) and Physics-Informed Neural Networks (PINNs). To simplify the problem, we focus on a prototype elliptic PDE: the Schrödinger equation on a hypercube with zero Dirichlet boundary condition, which is applied in quantum-mechanical systems. We establish upper and lower bounds for both methods, which improve upon concurrently developed upper bounds for this problem via a fast rate generalization bound. We discover that the current Deep Ritz Method is sub-optimal and propose a modified version of it. We also prove that PINN and the modified version of DRM can achieve minimax optimal bounds over Sobolev spaces. Empirically, following recent work which has shown that the deep model accuracy will improve with growing training sets according to a power law, we supply computational experiments to show similar behavior of dimension dependent power law for deep PDE solvers.

Minimax Optimal Kernel Operator Learning via Multilevel Training

What is the most efficient route from Times Square to Chelsea Market that minimizes walking?

Option 1: Subway

1. **Walk to a Nearby Subway Entrance:** Head to the Times Sq–42nd Street station.
2. **Board the E Train:** Catch an E train heading downtown (toward World Trade Center).
3. **Ride to 8th Avenue–14th Street Station:** Get off at this station (roughly 4 stops).
4. **Walk to Chelsea Market:** Exit the station and walk east on 14th Street for a few blocks until you reach Chelsea Market at 75 9th Avenue.

double-check
with a map

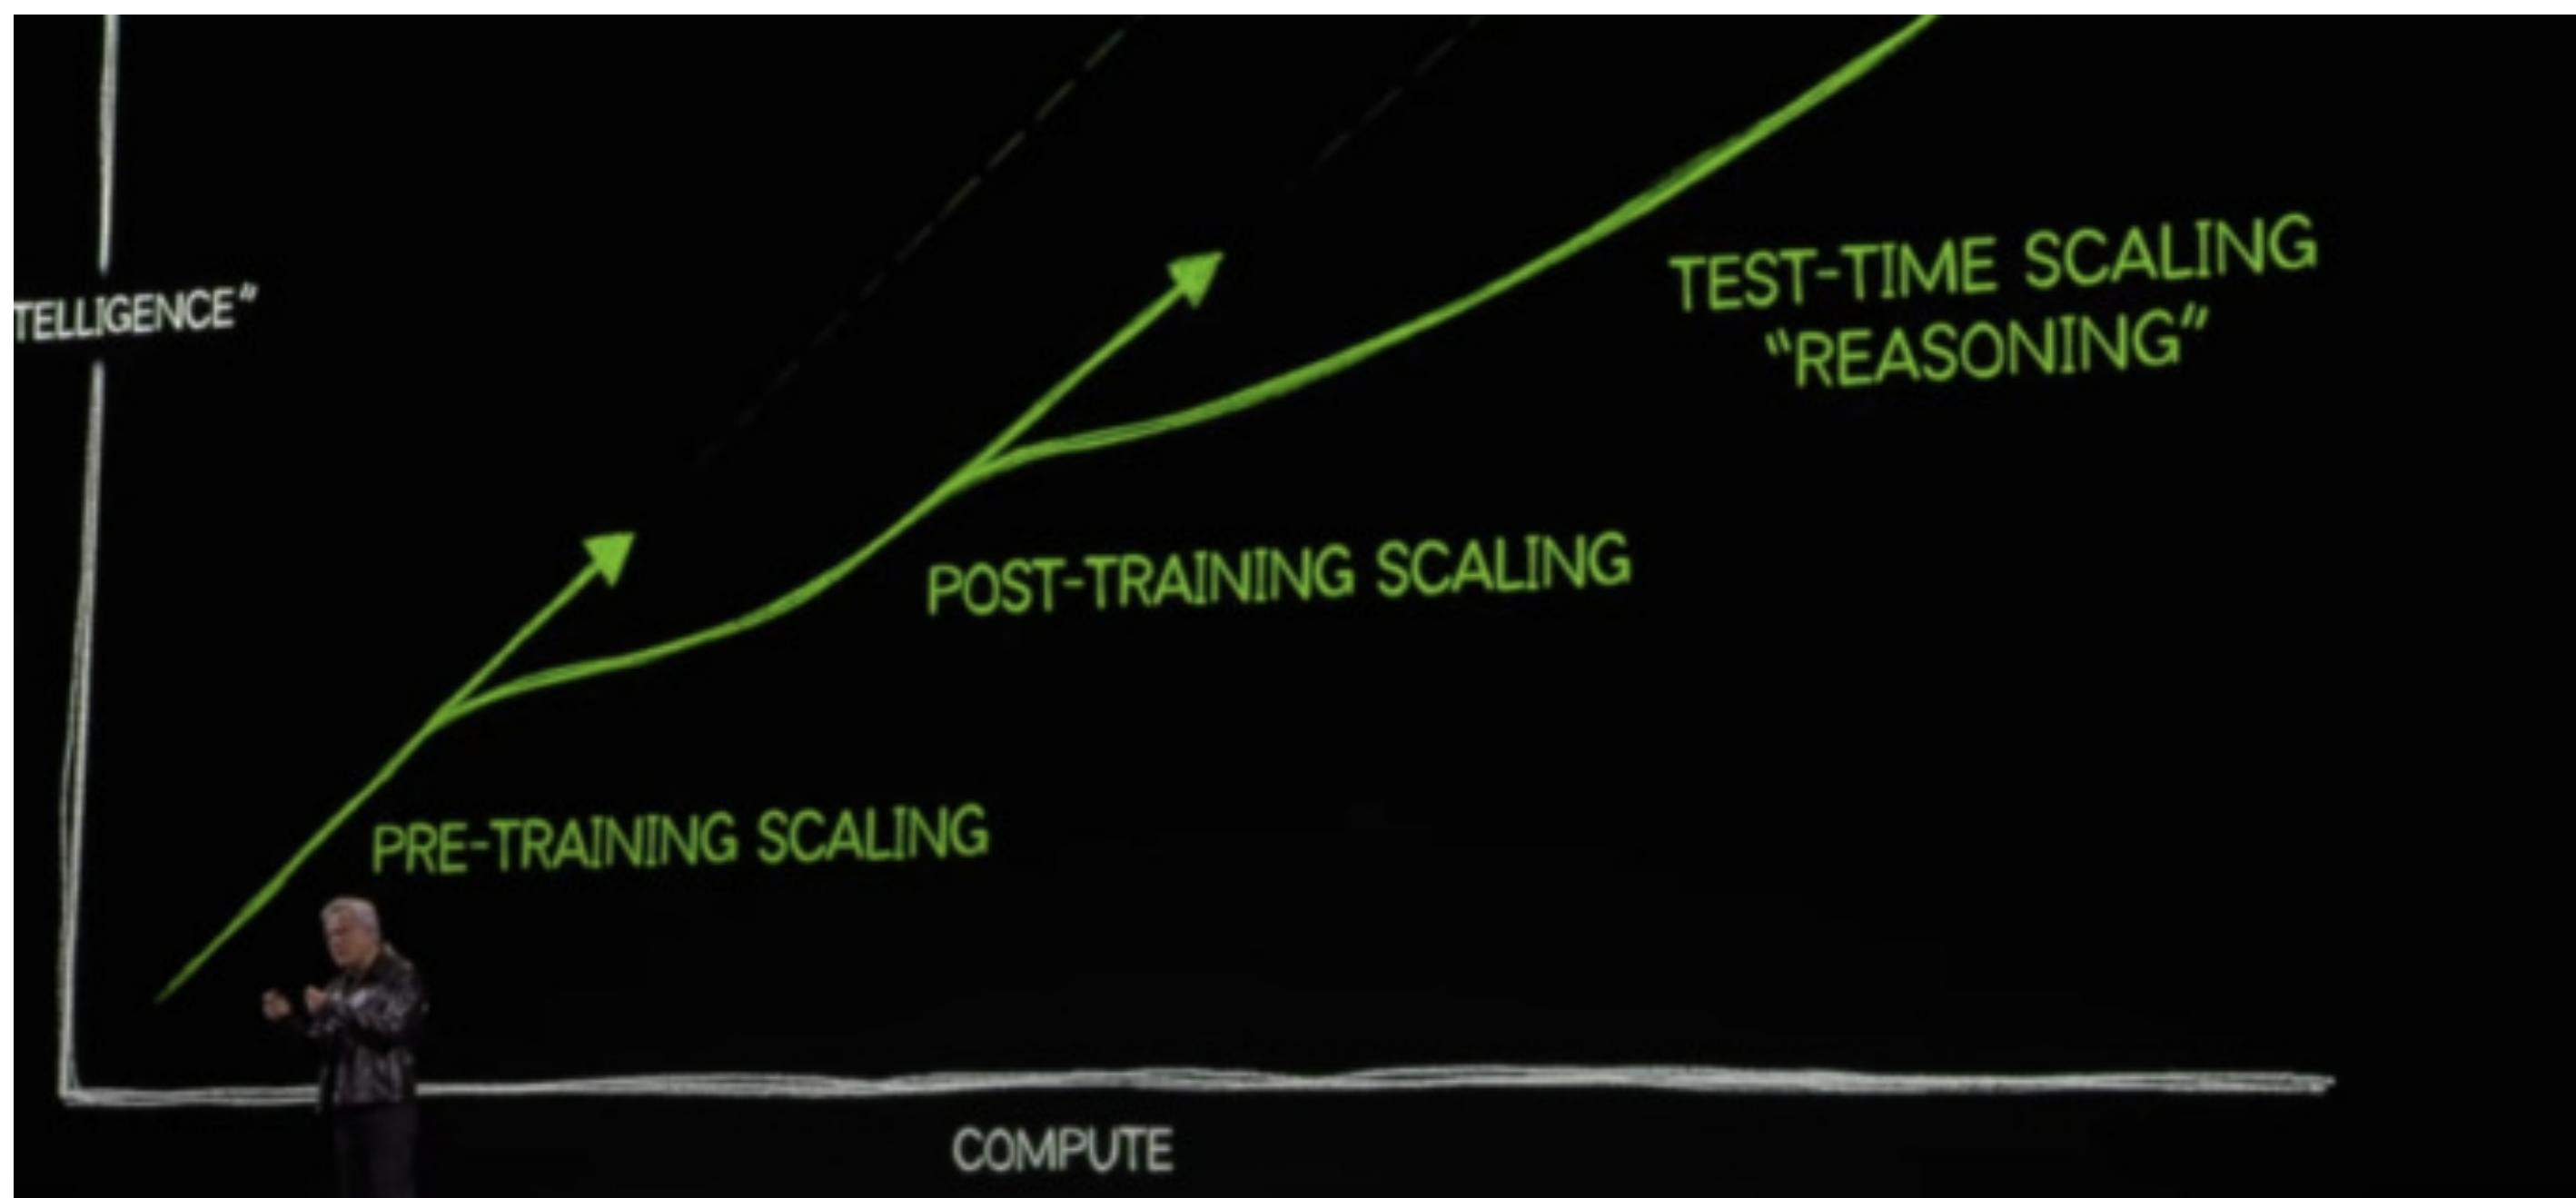

Port Authority

2 stops for A
3 stops for C/E

1. **At Times Square:** Enter the Times Square–42nd Street station.
2. **Board the 1 Train:** Hop on a downtown 1 train (the red line).
3. **Ride to 14th Street:** Stay on until you reach the 14th Street station.
4. **Exit Appropriately:** Use the exit that leads toward 9th Avenue—this drop-off point is just a short walk from Chelsea Market (located at 75 9th Ave).

Inference Time Scaling Law

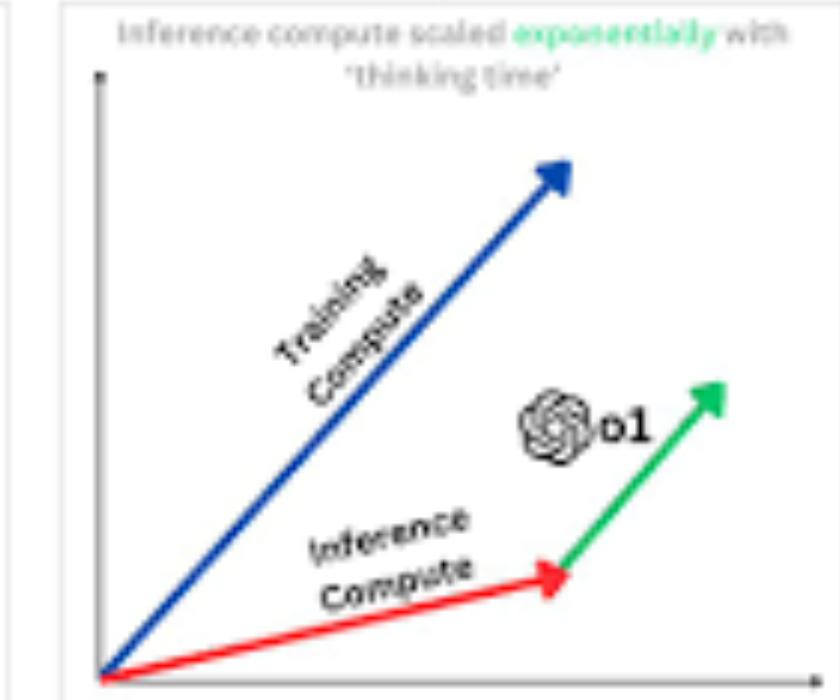

New scaling law: why OpenAI's o1 model matters
OpenAI created a new way to scale - through more compute during generation

Before OpenAI o1

Optimal Algorithms

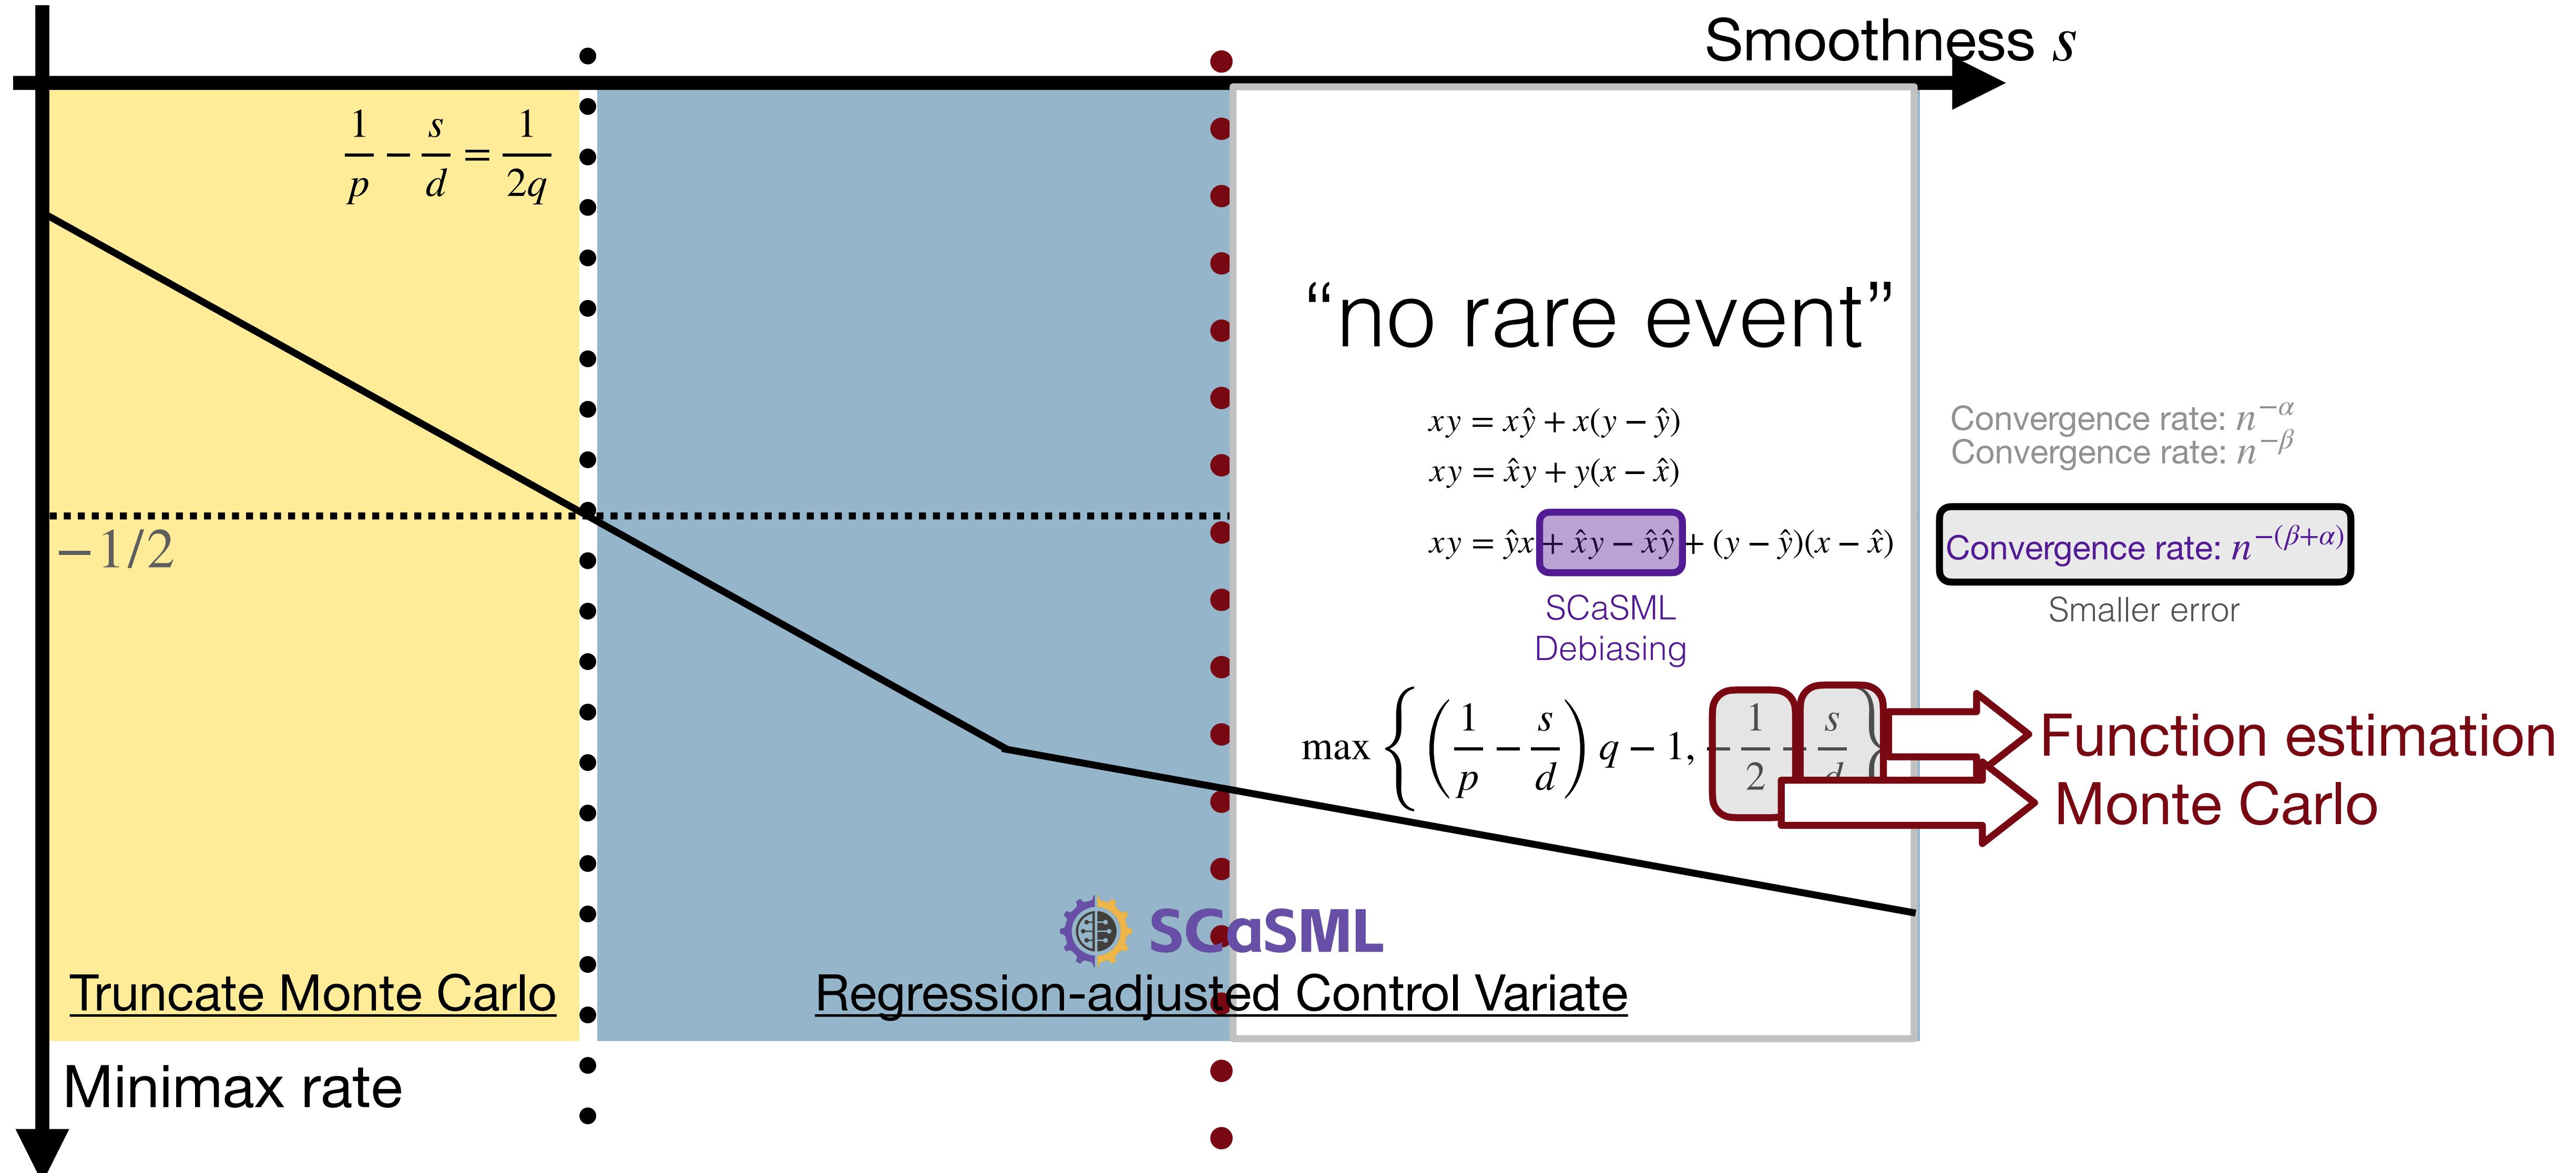

Easiest Understanding

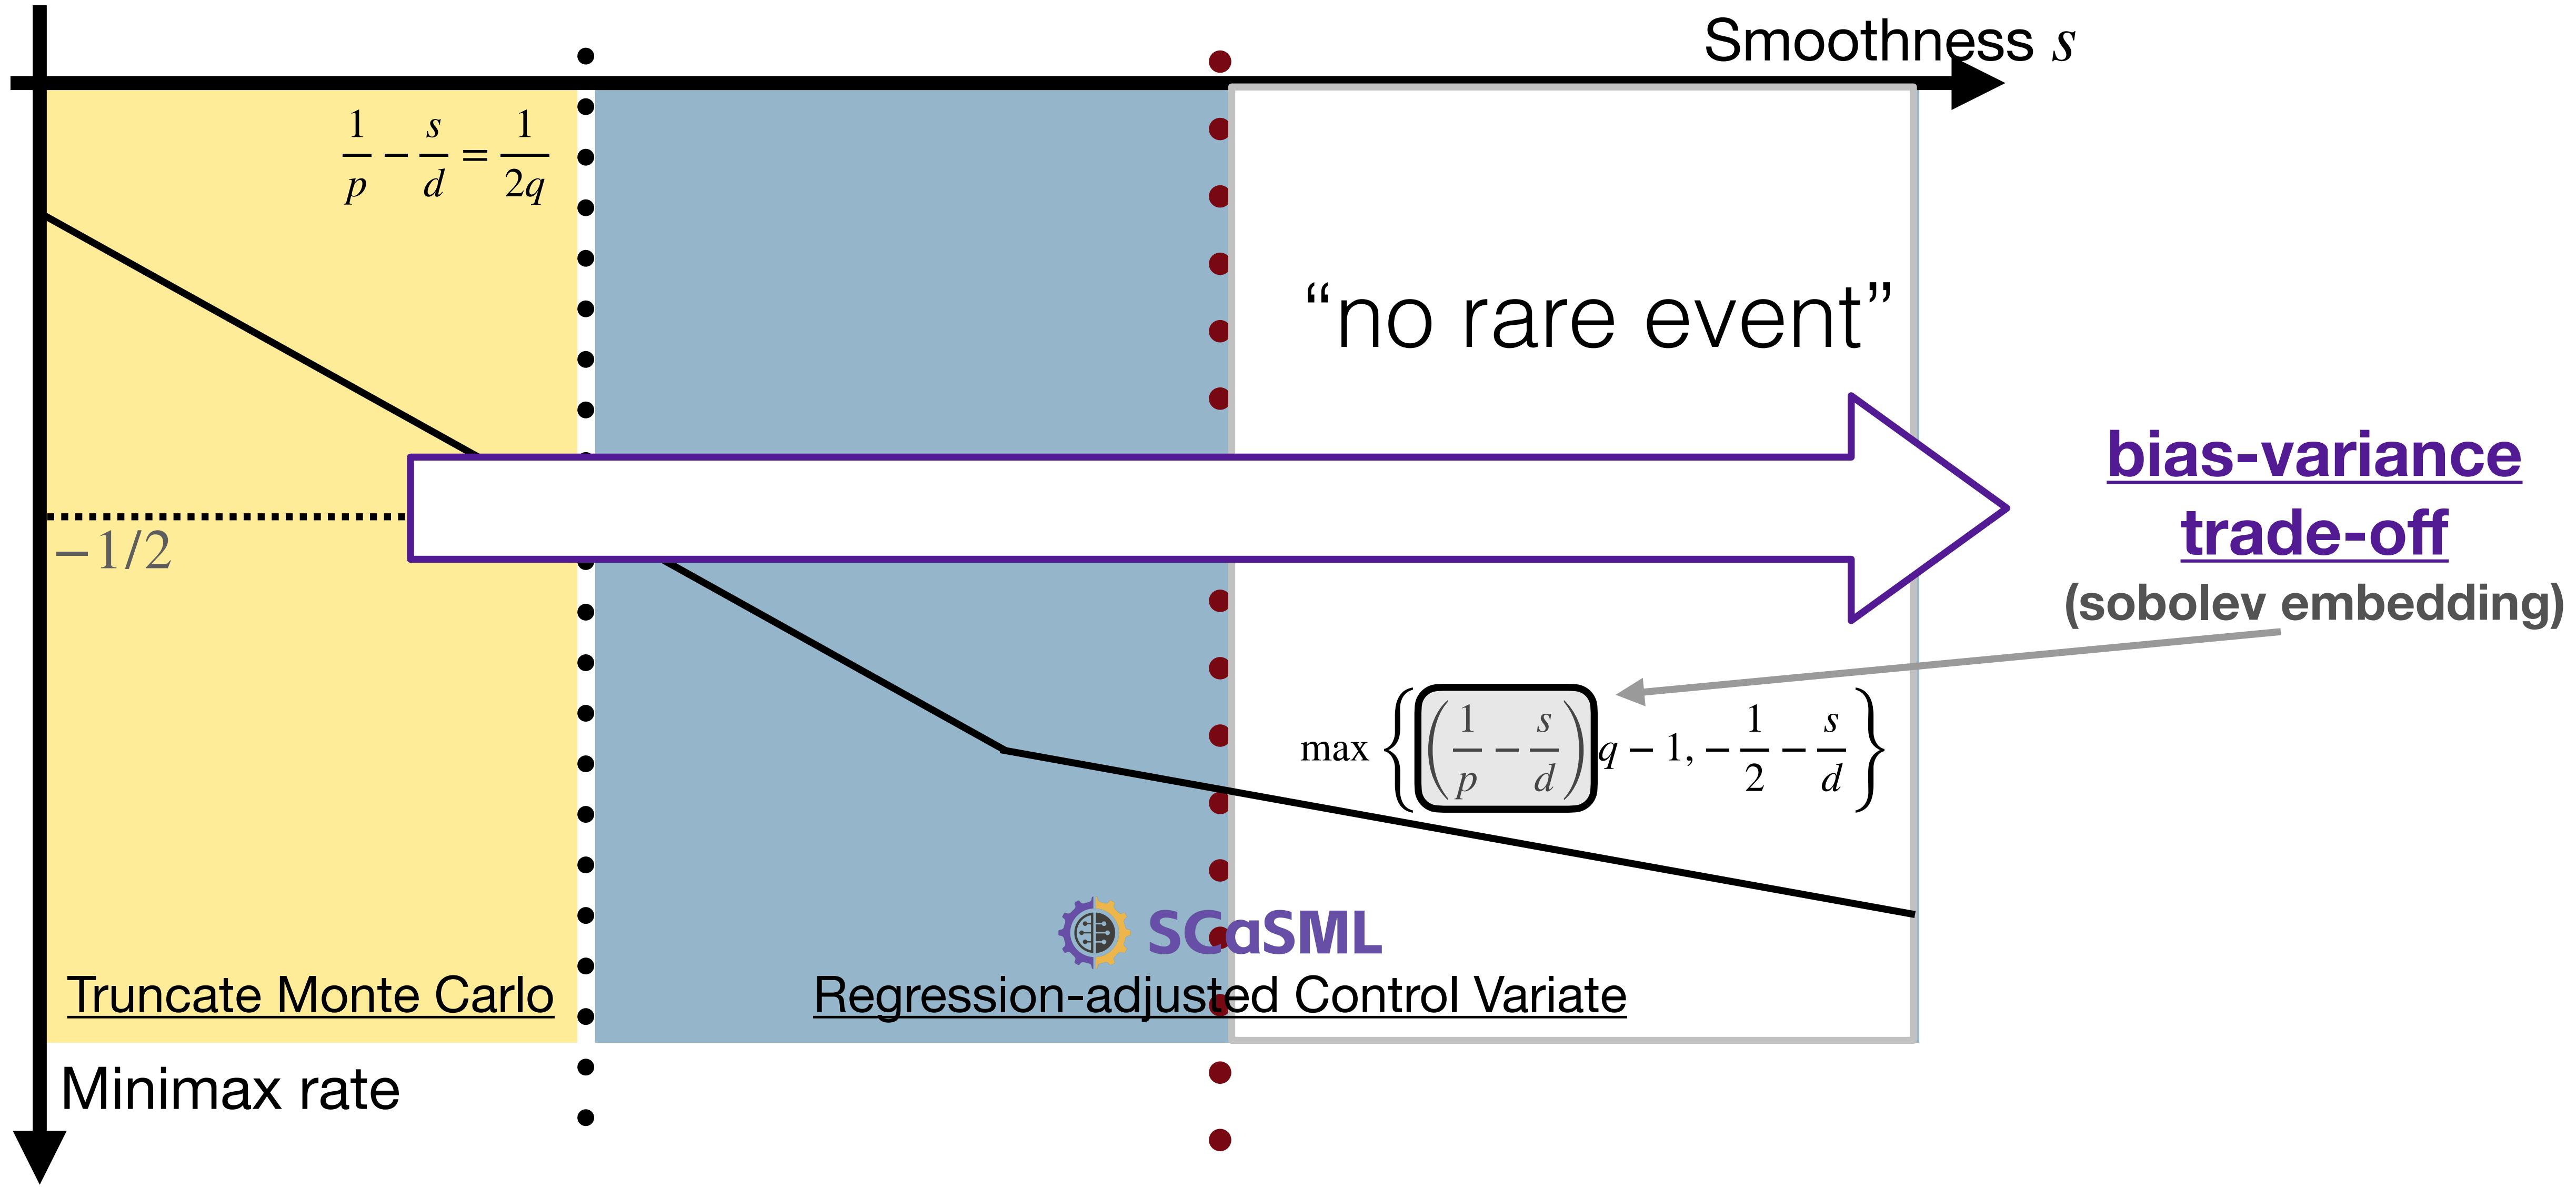

Easiest Understanding

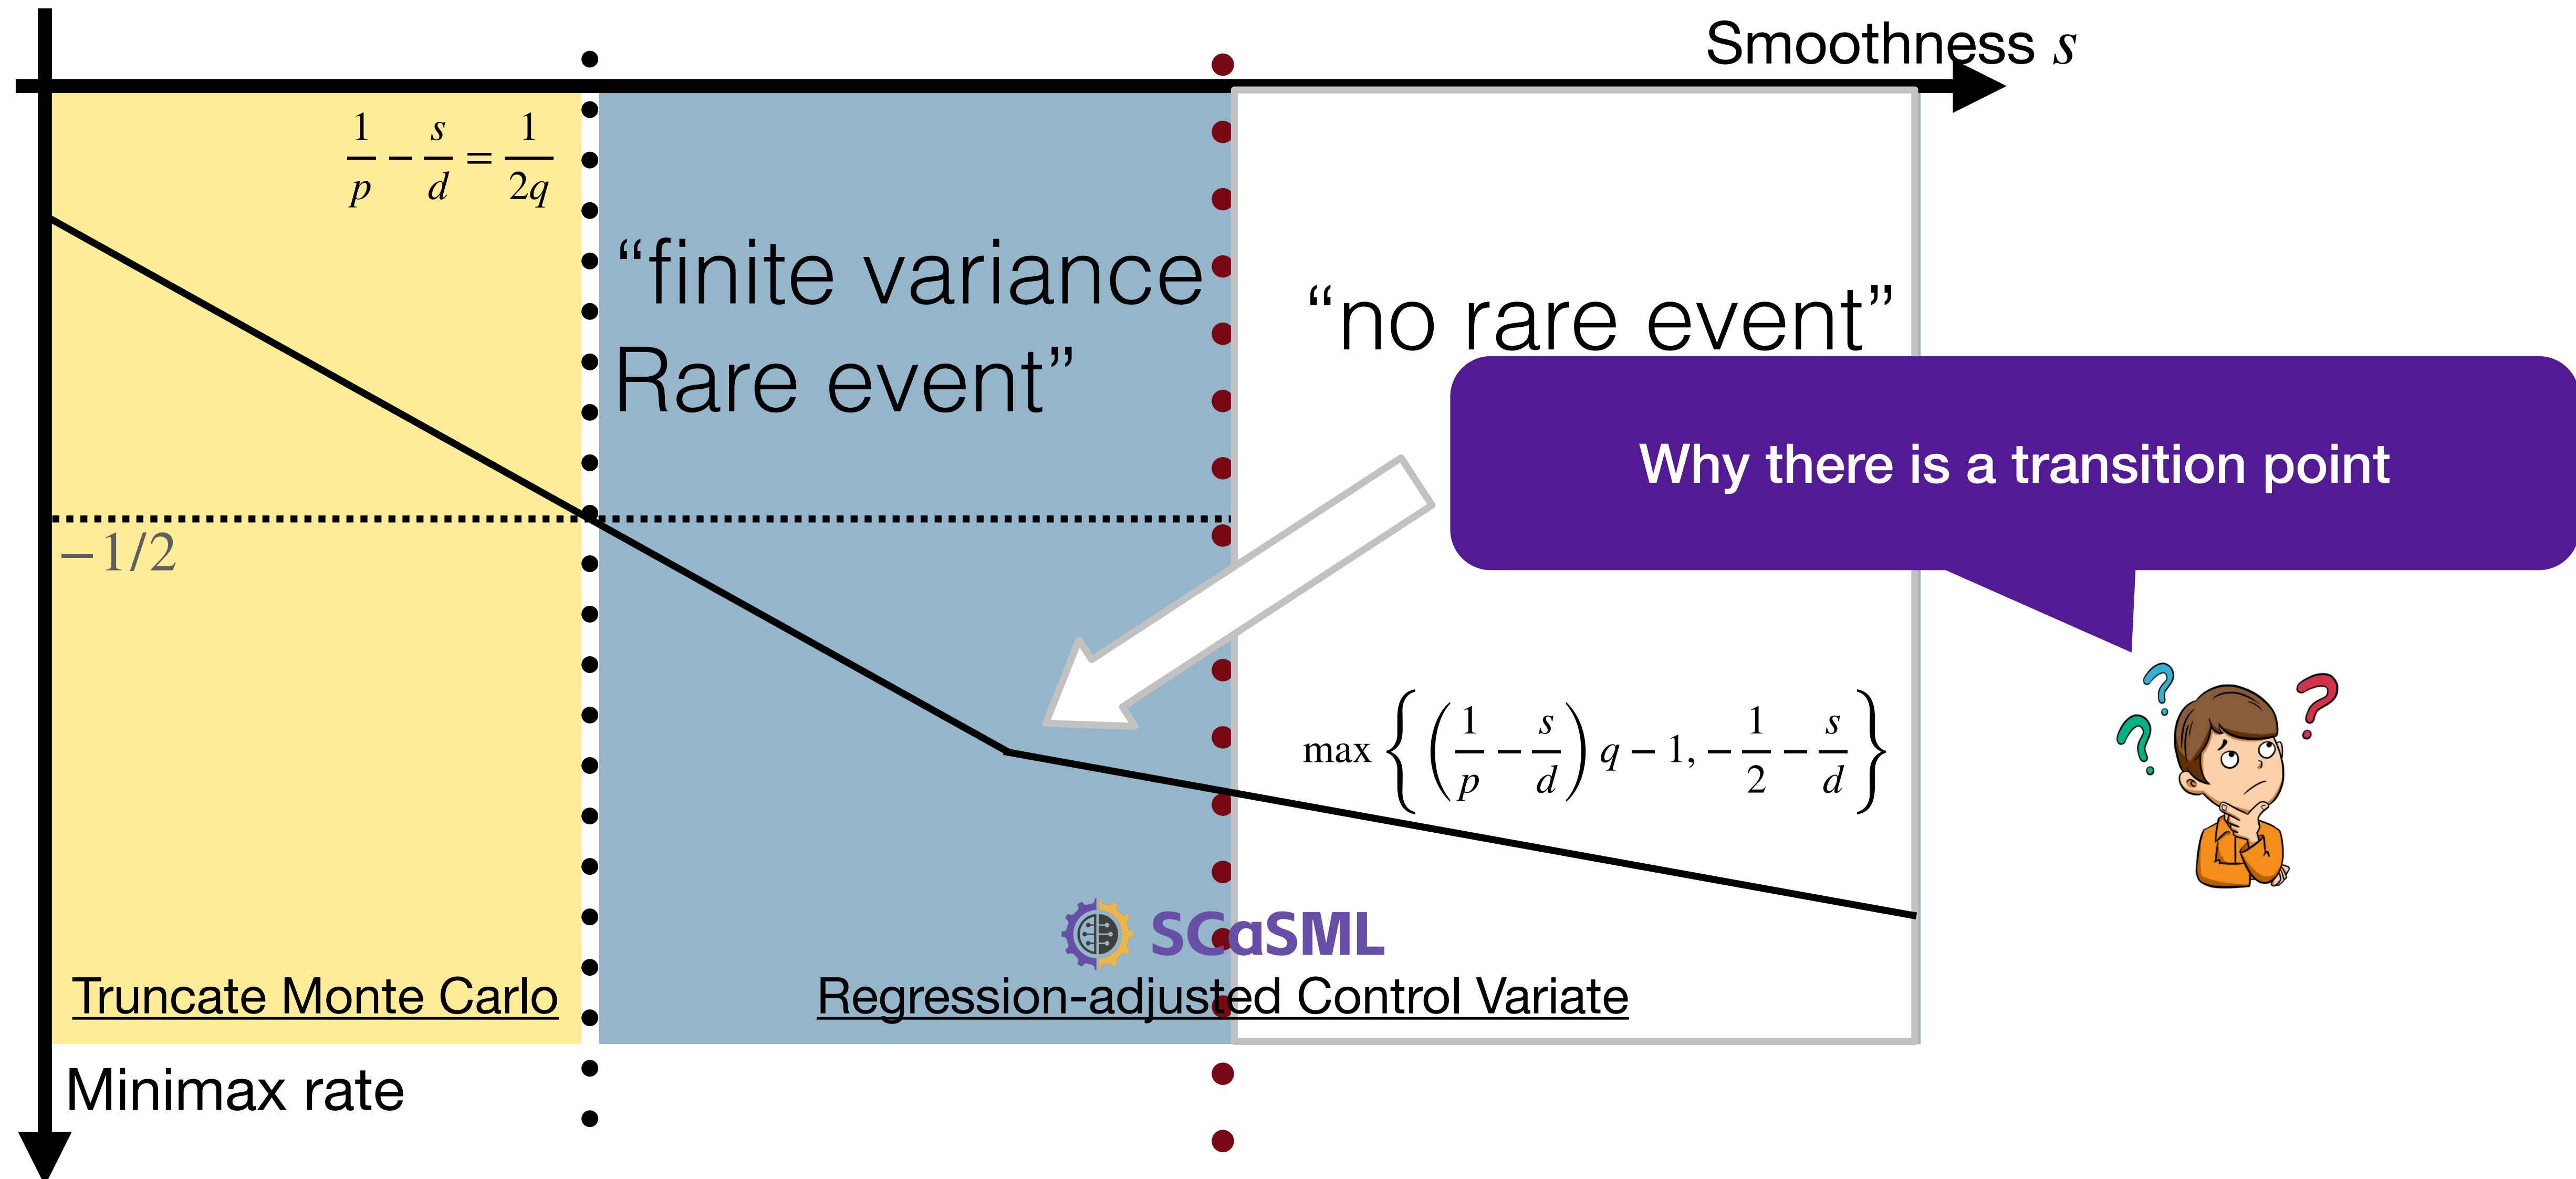

Easiest Understanding

Easiest Understanding

I Why...

Analysis of Error propagation

 **SCaML** estimate of $\mathbb{E}_P f^q, f \in W^{s,p}$

Step 1

Using half of the data to estimate \hat{f}

Step 2

$$\mathbb{E}_P f^q = \mathbb{E}_P(\hat{f}^q) + \mathbb{E}_P(f^q - \hat{f}^q)$$

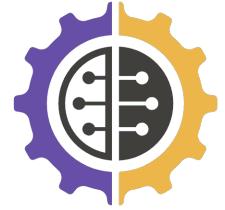

How does step 2 variance depend on estimation error?

Hardness = The variance of the debasing step

Analysis of Error propagation

 **SCaML** estimate of $\mathbb{E}_P f^q, f \in W^{s,p}$

Step 1

Using half of the data to estimate \hat{f}

Step 2

$$\mathbb{E}_P f^q = \mathbb{E}_P(\hat{f}^q) + \mathbb{E}_P(f^q - \hat{f}^q)$$

Low order term

$$f^{q-1}(f - \hat{f}) + (f - \hat{f})^q$$

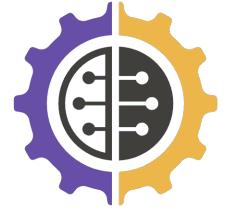

How does step2 variance
depend on estimation error?

“influence function” (gradient)

Error propagation

Analysis of Error propagation

 **SCaML** estimate of $\mathbb{E}_P f^q, f \in W^{s,p}$

Step 1

Using half of the data to estimate \hat{f}

Step 2

$$\mathbb{E}_P f^q = \mathbb{E}_P(\hat{f}^q) + \mathbb{E}_P(f^q - \hat{f}^q)$$

Low order term

$$f^{q-1}(f - \hat{f}) + (f - \hat{f})^q$$

“influence function” (gradient)

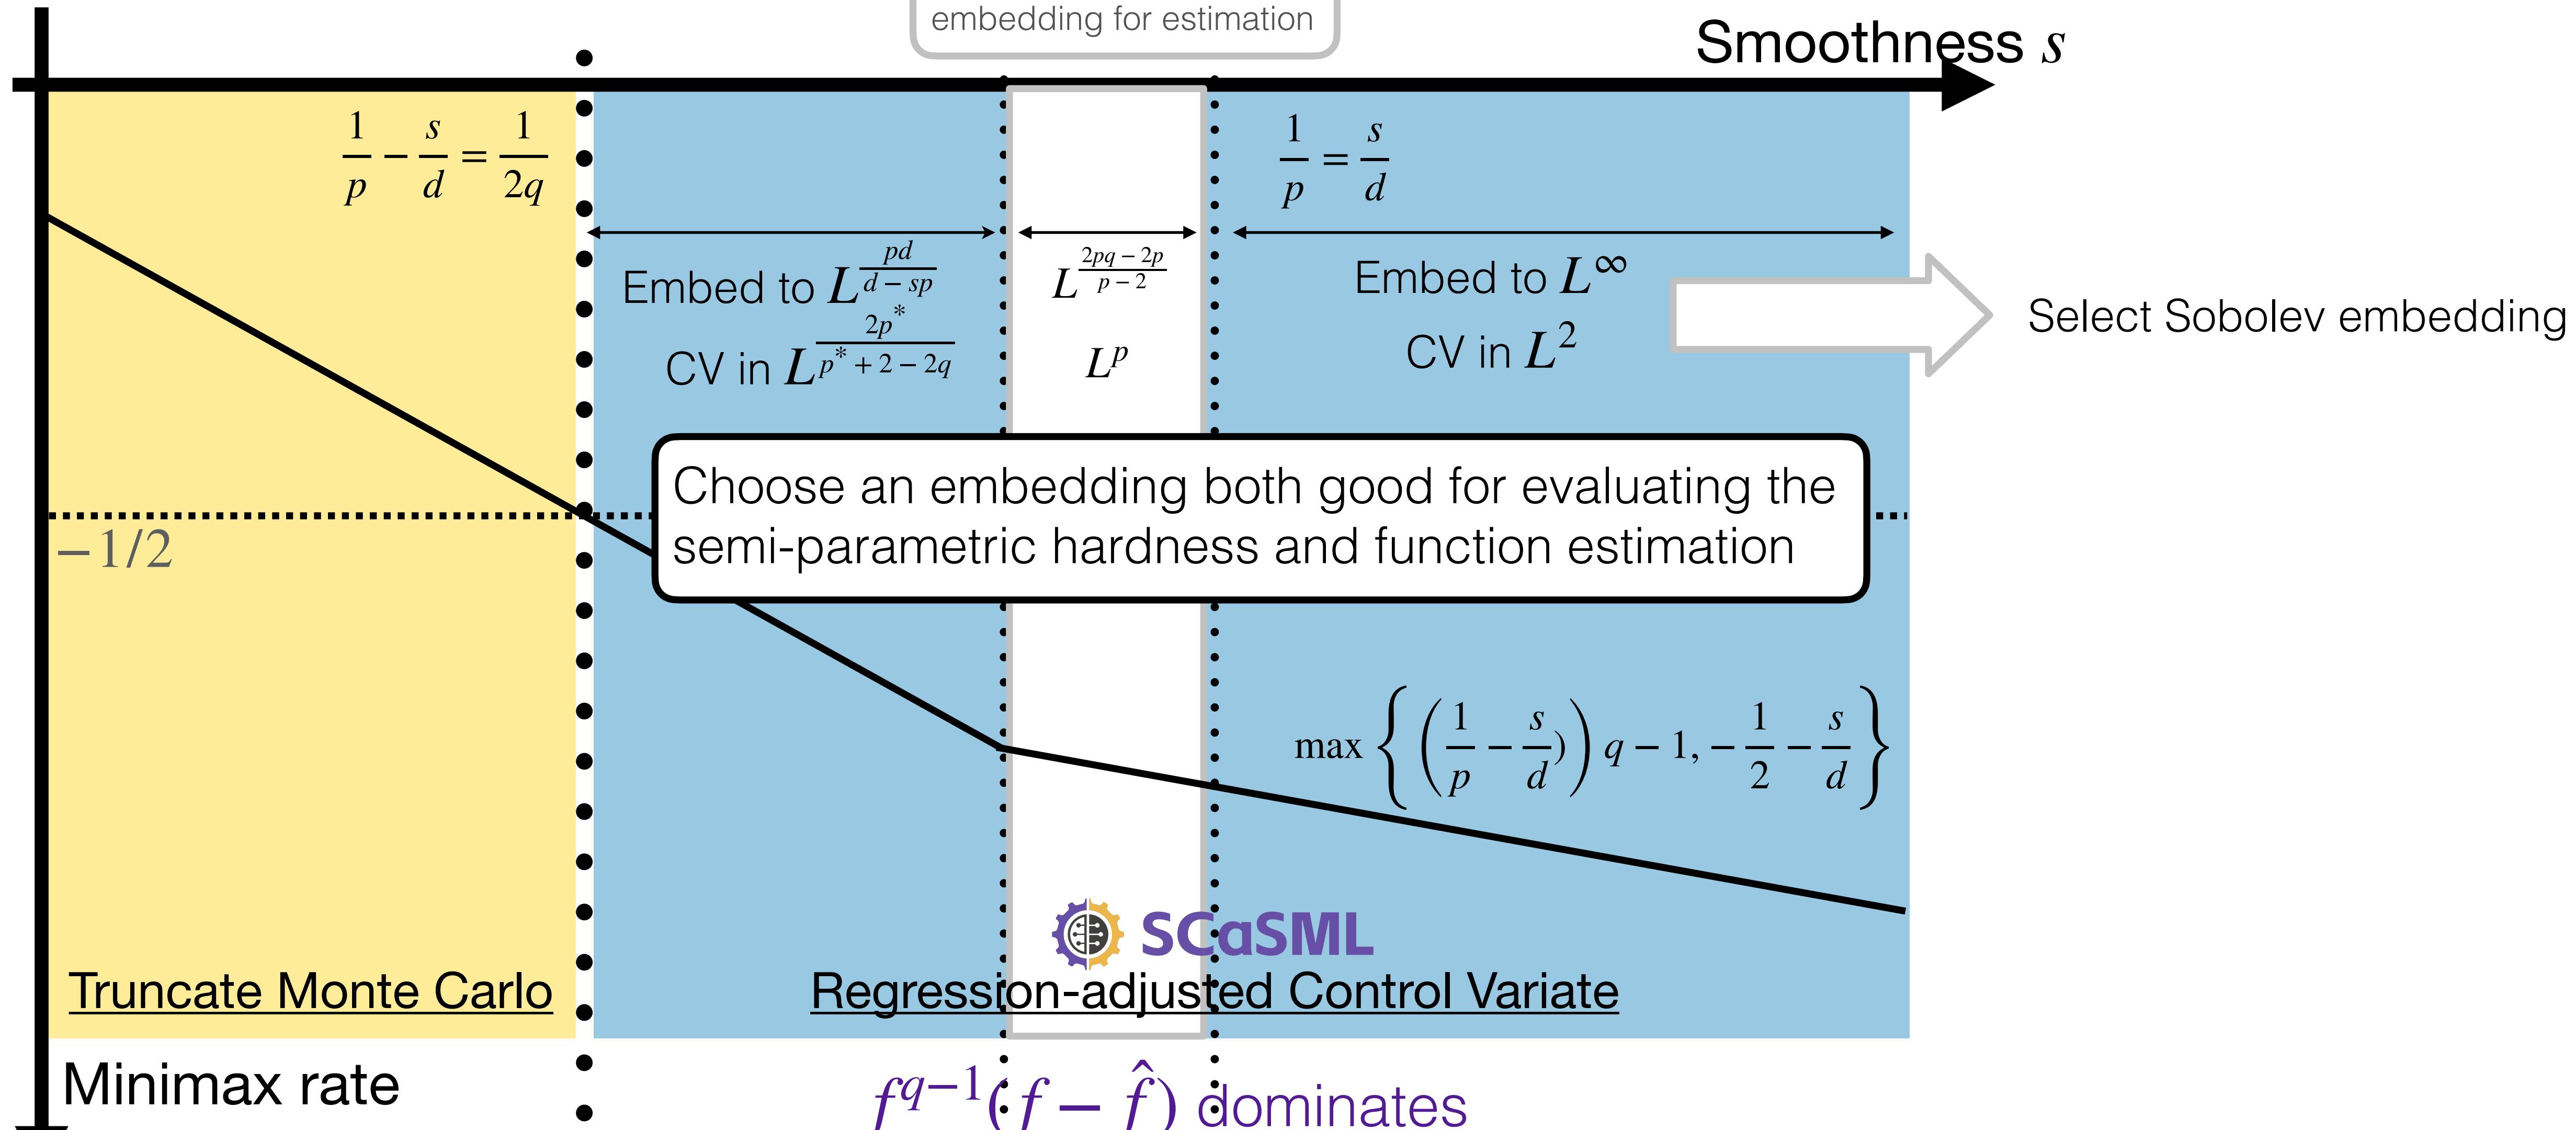

Error p

Embed f^{q-1} and $f - \hat{f}$ into “dual” space

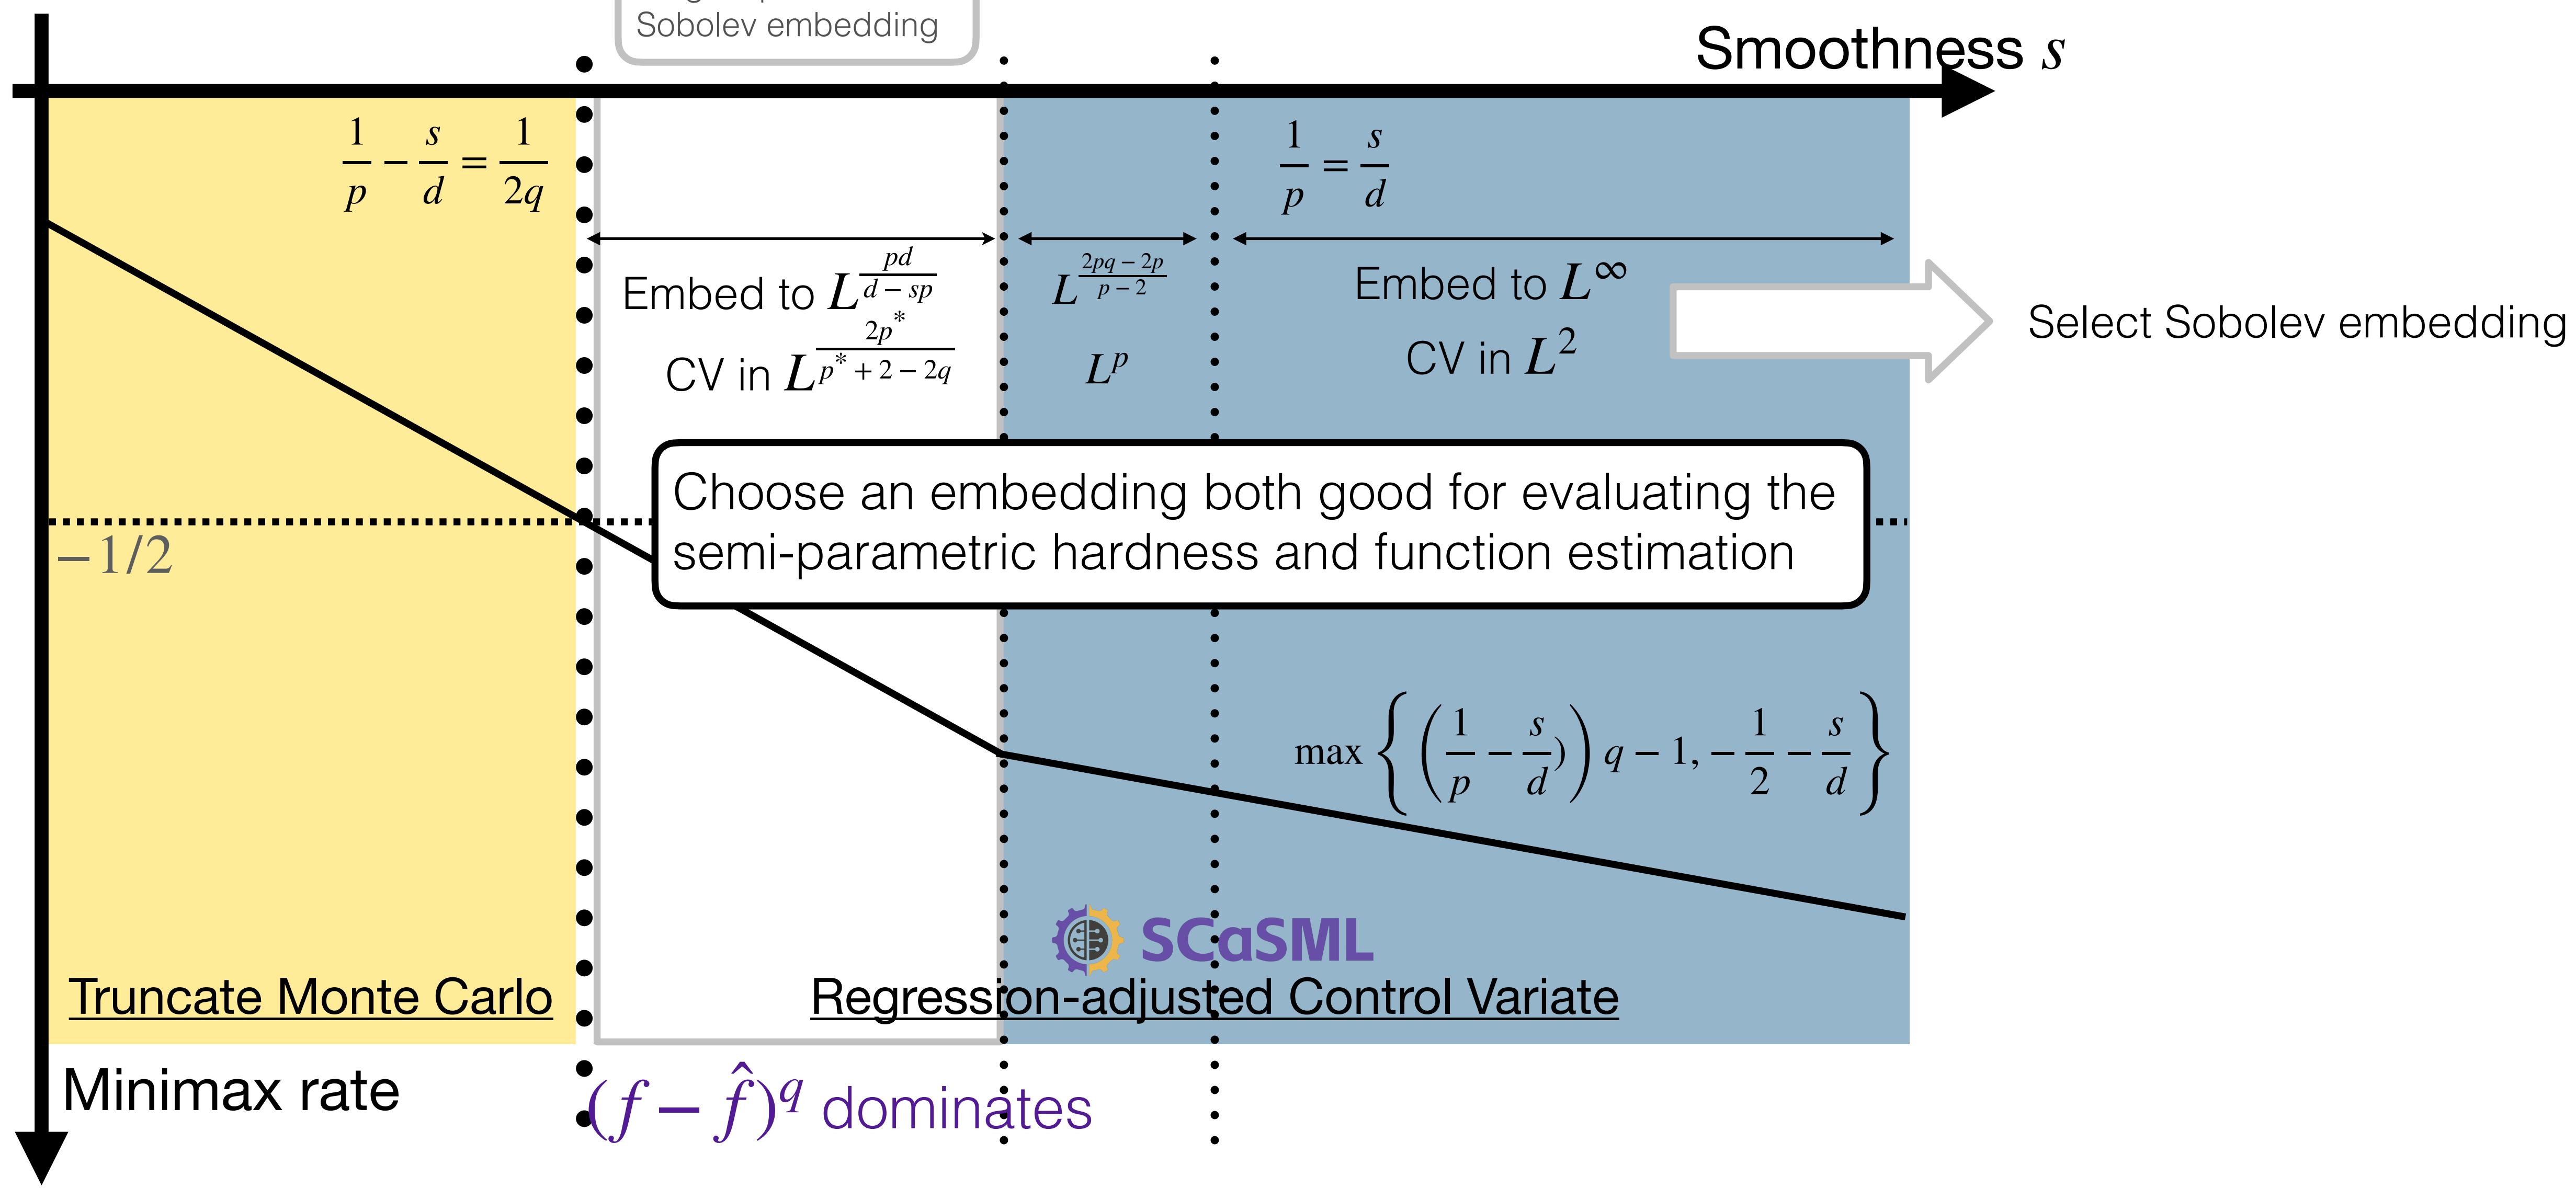

How to select the Sobolev embedding?

Selecting the Sobolev Embedding

Selecting the Sobolev Embedding

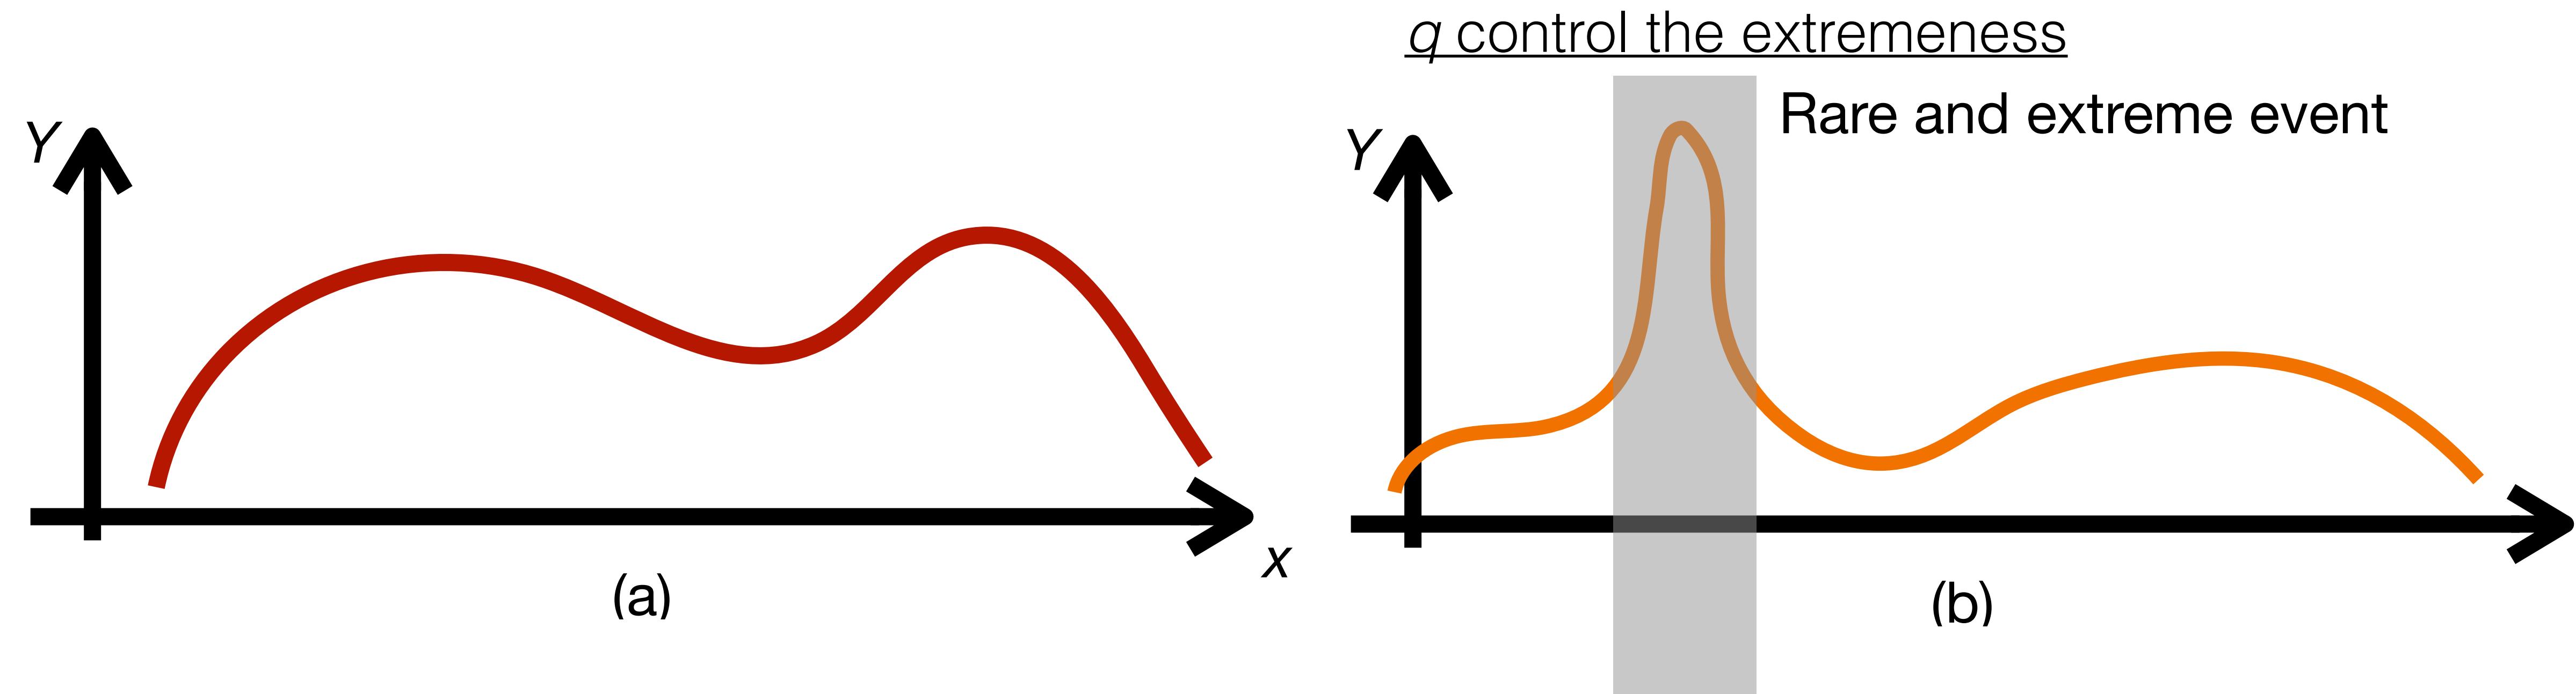

| Take Home Message on the Theory

SCaML

- a) Statistical optimal regression is the optimal control variate
- b) It helps only if there isn't a hard to simulate (infinite variance)

PDE Solver

High Dimensional PDE-Solving

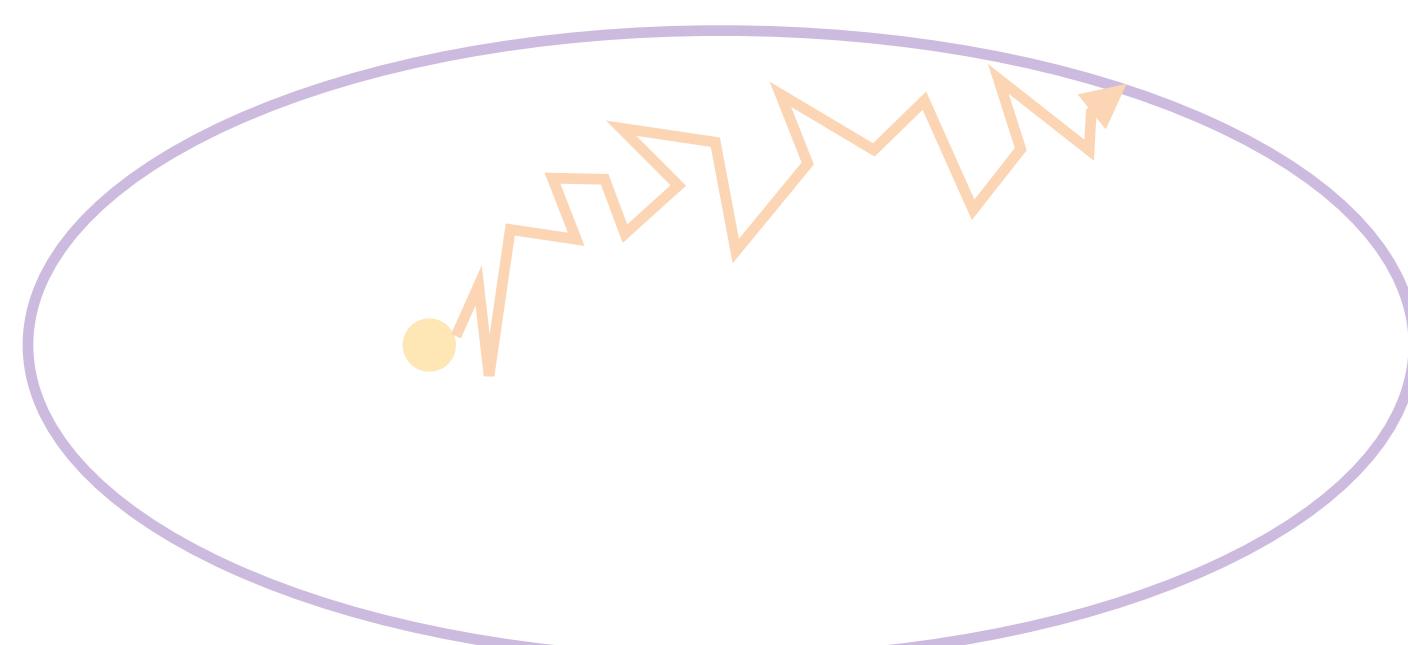

$$\Delta u = f$$

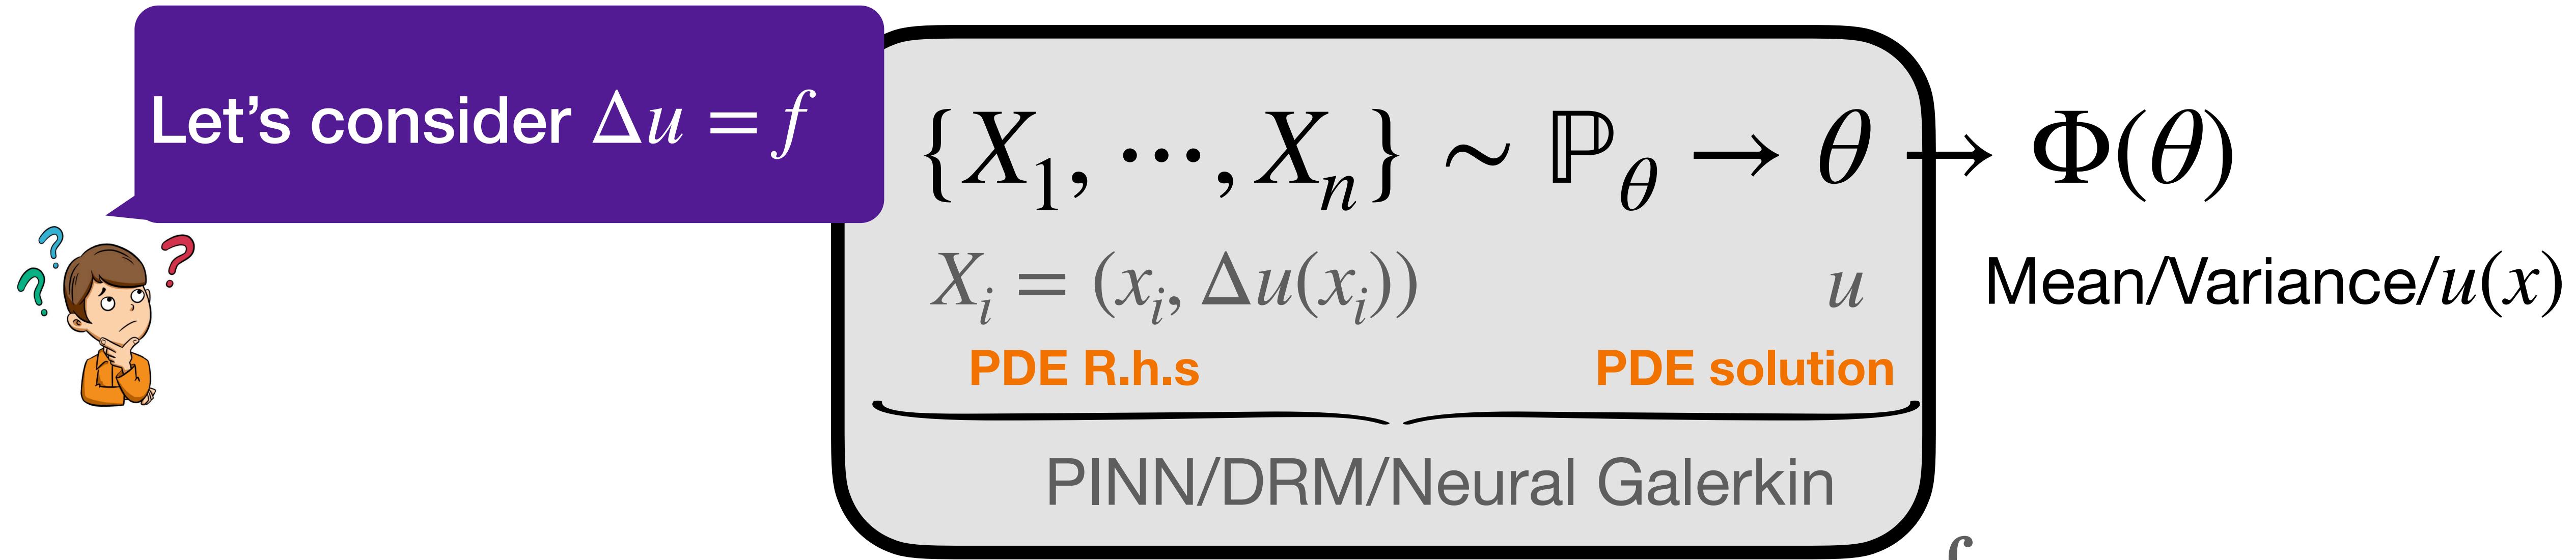

$$\Delta \hat{u} = \hat{f}$$

$$\Delta(u - \hat{u}) = f - \hat{f}$$

$$(u - \hat{u})(x) = \mathbb{E} \int (f - \hat{f})(X_t) dt$$

High Dimensional PDE-Solving

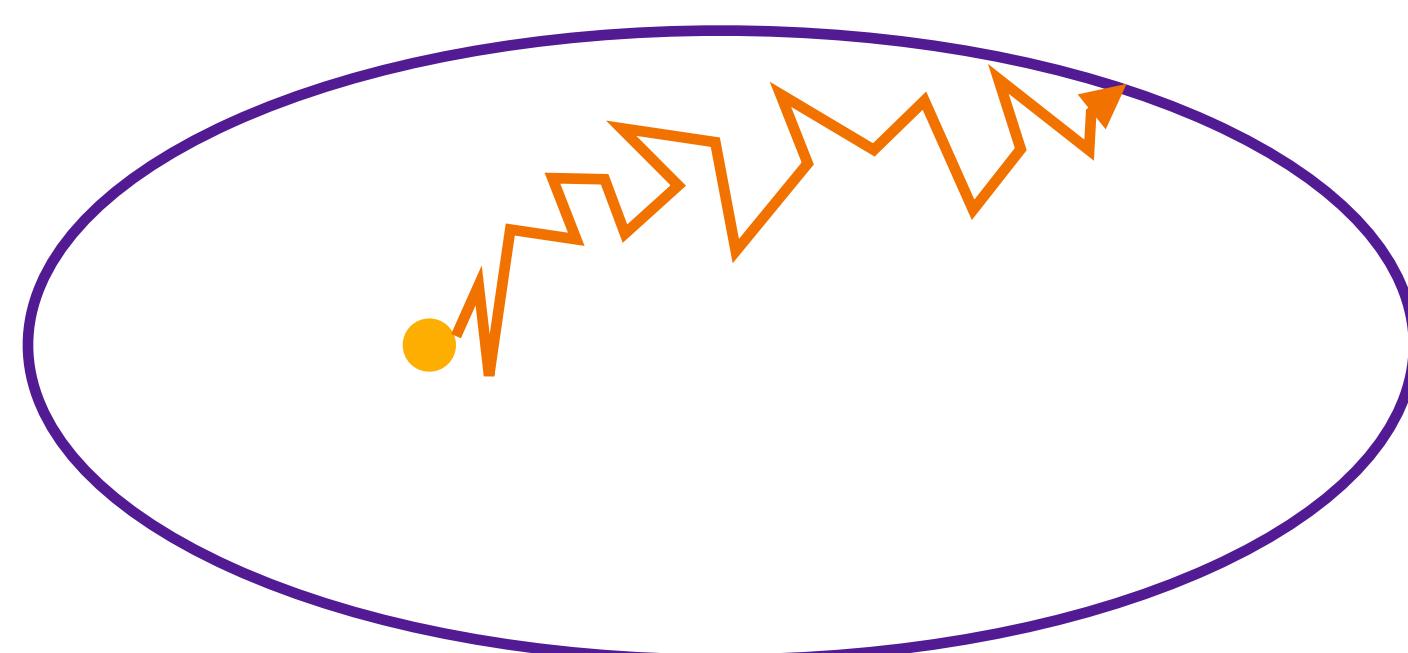

$$\Delta u = f$$

$$\Delta \hat{u} = \hat{f}$$

$$\Delta(u - \hat{u}) = f - \hat{f}$$

$$(u - \hat{u})(x) = \mathbb{E} \int (f - \hat{f})(X_t) dt$$

Works for Semi-linear PDE

$$\frac{\partial U}{\partial t}(x, t) + \boxed{\Delta U(x, t)} + f(U(x, t)) = 0$$

Keeps the structure to enable brownian motion simulation

Can you do simulation
for nonlinear equation?

Δ is linear!

Works for Semi-linear PDE

$$\frac{\partial U}{\partial t}(x, t) + \boxed{\Delta U(x, t)} + f(U(x, t)) = 0$$

Keeps the structure to enable brownian motion simulation

$$\frac{\partial \hat{U}}{\partial t}(x, t) + \boxed{\Delta \hat{U}(x, t)} + f(\hat{U}(x, t)) = g(x, t)$$

$g(x, t)$ is the error made by NN

Works for Semi-linear PDE

$$\frac{\partial U}{\partial t}(x, t) + \boxed{\Delta U(x, t)} + f(U(x, t)) = 0$$

Keeps the structure to enable brownian motion simulation

$$\frac{\partial \hat{U}}{\partial t}(x, t) + \boxed{\Delta \hat{U}(x, t)} + f(\hat{U}(x, t)) = g(x, t)$$

NN

g(x, t) is the error made by NN

Subtract two equations

$$\frac{\partial(U - \hat{U})}{\partial t}(x, t) + \boxed{\Delta(U - \hat{U})(x, t)} + \underbrace{f(t, \hat{U}(x, t) + U(x, t) - \hat{U}(x, t)) - f(t, \hat{U}(x, t))}_{G(t, (U - \hat{U})(x, t))} = g(x, t).$$

Keeps the linear structure

Tale 2: Pre-condition with a surprising connection with debiasing

Tale 2: Preconditioning

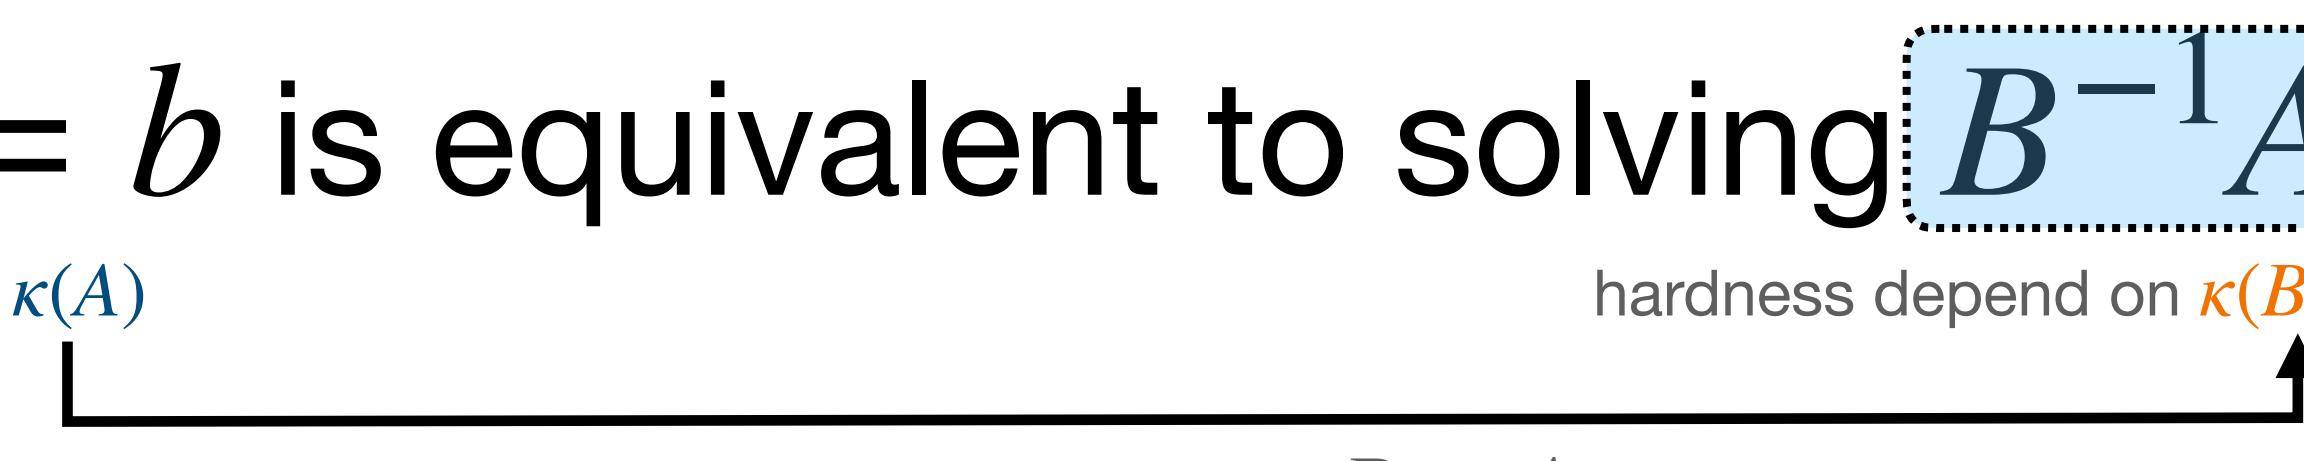

"In ending this book with the subject of preconditioners, we find ourselves at the philosophical center of the scientific computing of the future."

— L. N. Trefethen and D. Bau III, Numerical Linear Algebra [TB22]

Nothing will be more central to computational science in the next century than **the art of transforming a problem that appears intractable into another whose solution can be approximated rapidly**.

What is precondition

- Solving $Ax = b$ is equivalent to solving $B^{-1}Ax = B^{-1}b$
hardness depend on $\kappa(A)$ hardness depend on $\kappa(B^{-1}A)$

Become easier when $B \approx A$

A New Way to Implement Precondition

- Debiasing is a way of solving $Ax = b$
 - Using an approximate solver $Bx_1 = b$

A New Way to Implement Precondition

- Debiasing is a way of solving $Ax = b$
 - Using an approximate solver $Bx_1 = b$
 - $x - x_1$ satisfies the equation $A(x - x_1) = b - Ax_1$
 - Using the approximate solver to approximate $x - x_1$ via $Bx_2 = b - Ax_1$

Easy to solve for $b - Ax_1$ is small

A New Way to Implement Precondition

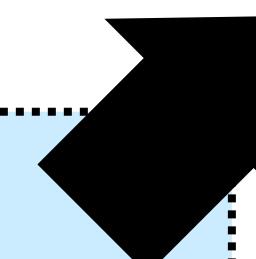

- Debiasing is a way of solving $Ax = b$

- Using an approximate solver $Bx_1 = b$

Iterative Refinement Algorithm

. $x - \sum_{i=1}^t x_i$ satisfies the equation $A(x - \sum_{i=1}^t x_i) = b - A \sum_{i=1}^t x_i$

. Using the approximate solver to approximate $x - \sum_{i=1}^t x_i$ via $Bx_{i+1} = b - A \sum_{i=1}^t x_i$

A New Way to Implement Precondition

- Debiasing is a way of solving $Ax = b$

- Using an approximate solver $Bx_1 = b$

Iterative Refinement Algorithm

. $x - \sum_{i=1}^t x_i$ satisfies the equation $A(x - \sum_{i=1}^t x_i) = b - A \sum_{i=1}^t x_i$

. Using the approximate solver to approximate $x - \sum_{i=1}^t x_i$ via $Bx_{i+1} = b - A \sum_{i=1}^t x_i$

$$x_{i+1} = (I - B^{-1}A)x_i + B^{-1}b$$

Preconditioned Jacobi Iteration

This Talk: A New Way to Implement Precondition Via Debiasing

- **Step 1:** Aim to solve (potentially nonlinear) equation $A(u) = b$

use Machine Learning

- **Step 2:** Build an approximate solver $A(\hat{u}) \approx b$

Unreliable approximate
solver as preconditioner

- Via machine learning/sketching/finite element....

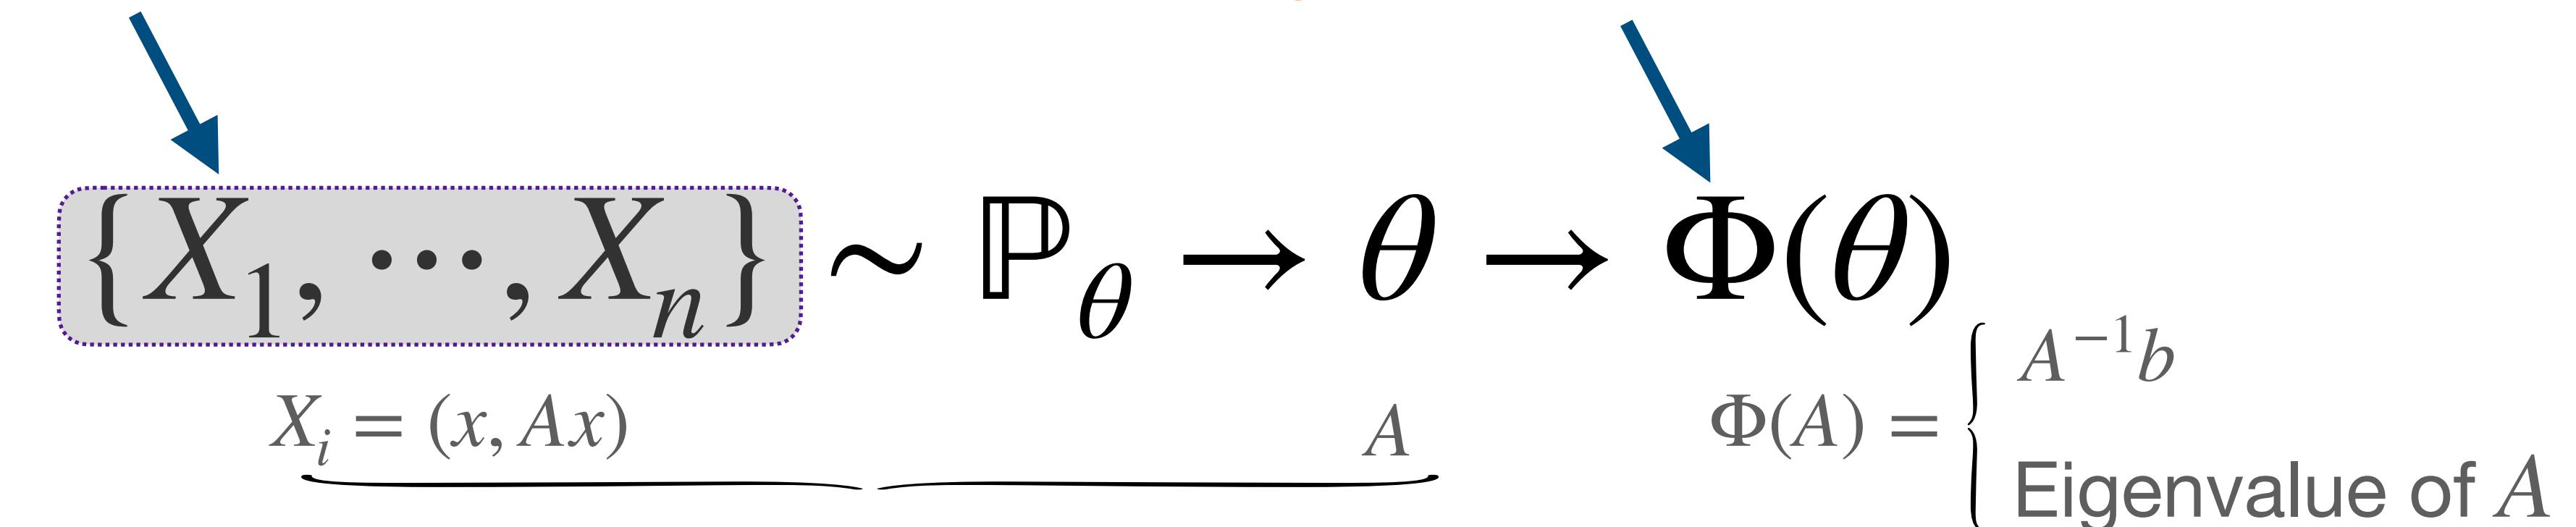

- **Step 3:** Solve $u - \hat{u}$

(c) $n = 4000, \kappa = 10^{-6}$

What is a Sketch-and-Precondition Derivation for Low-Rank Approximation? Inverse Power Error or Inverse Power Estimation?

Ruihan Xu *

Yiping Lu †

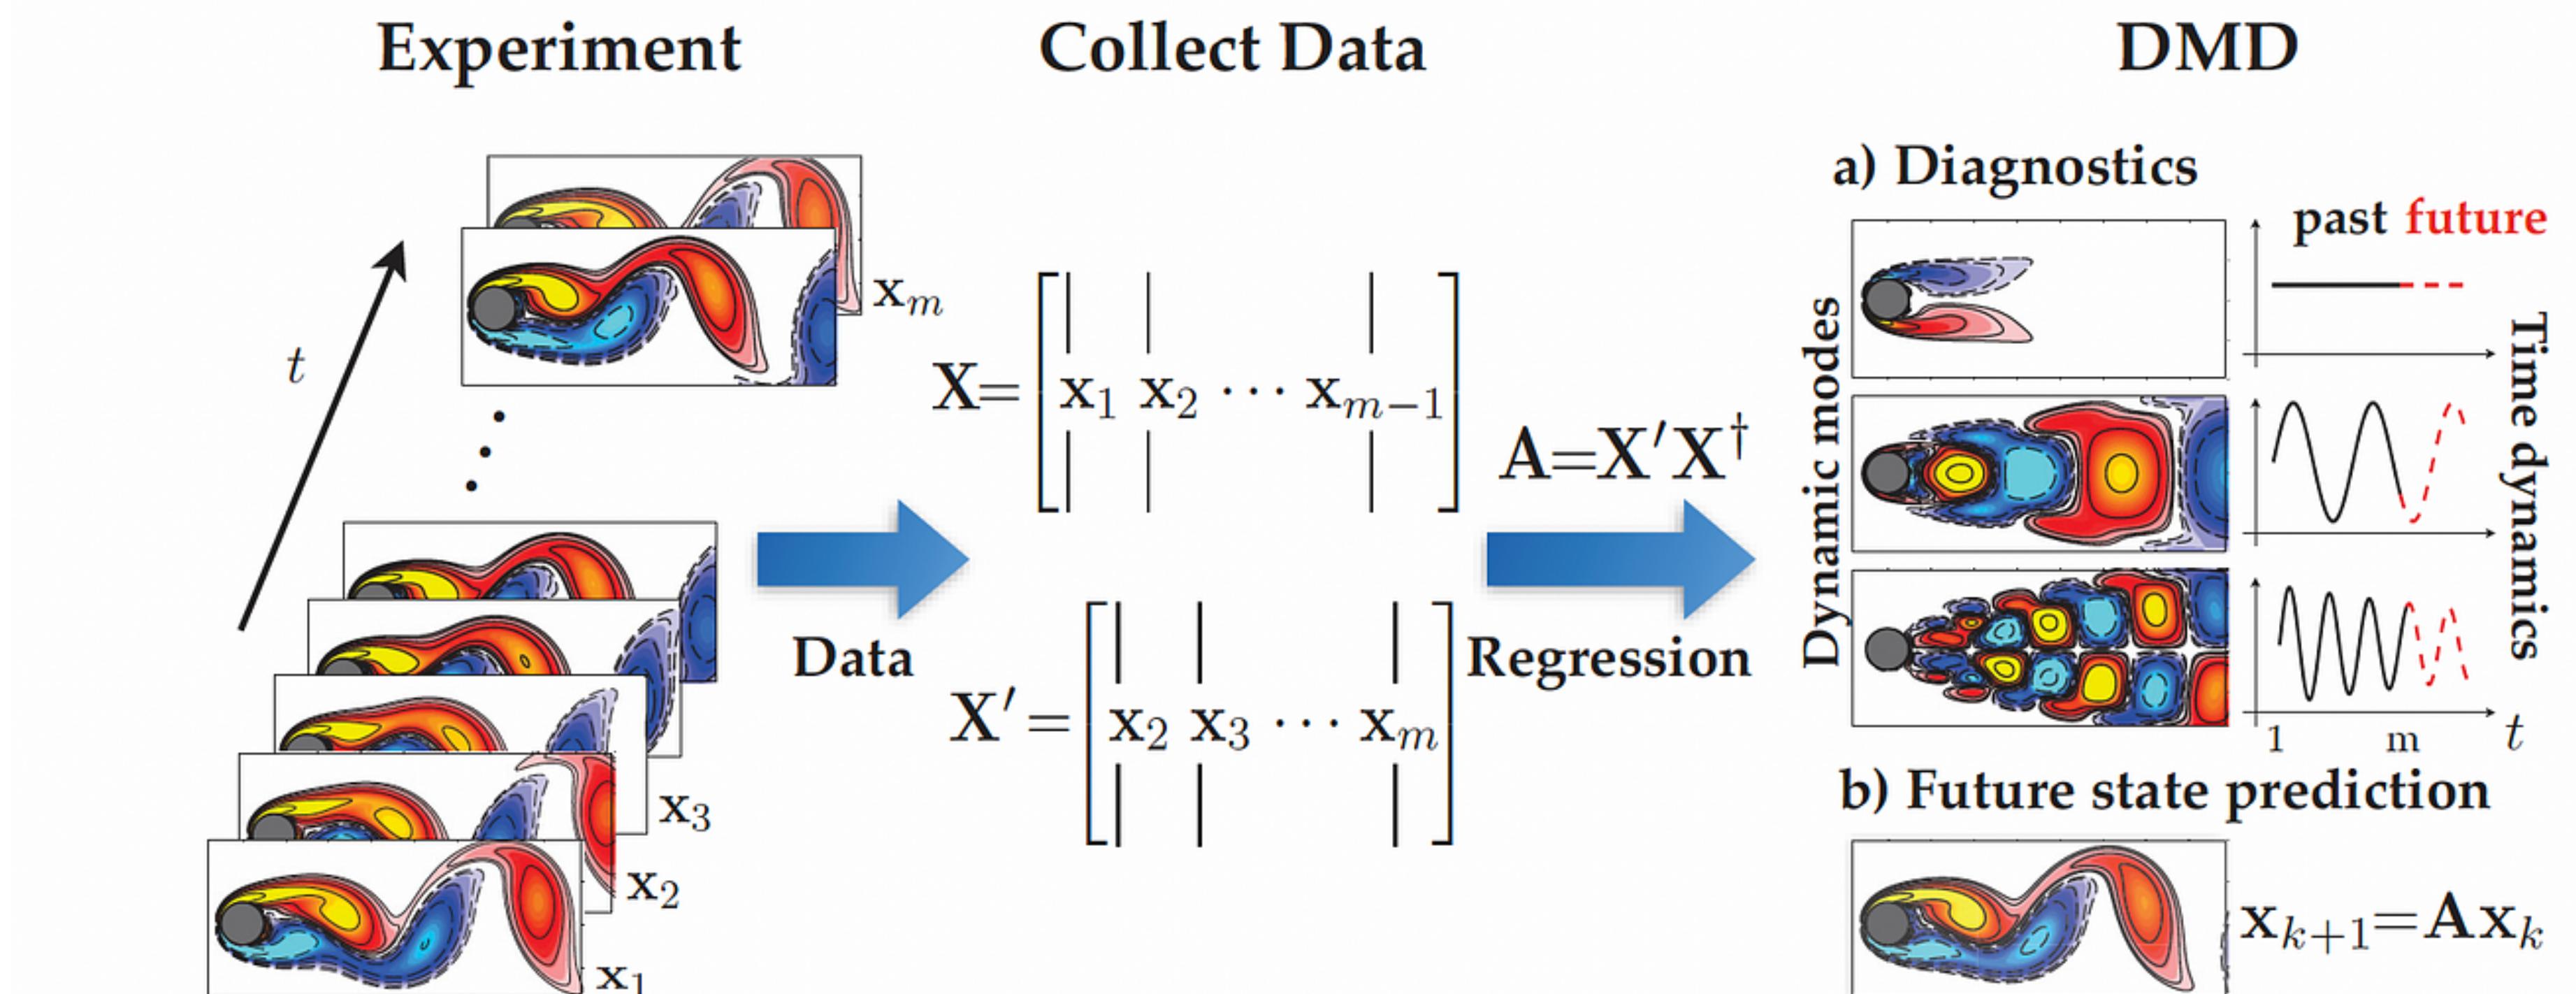

Abstract

Randomized sketching accelerates large-scale numerical linear algebra by reducing computational complexity. While the traditional sketch-and-solve approach reduces the problem size directly through sketching, the sketch-and-precondition method leverages sketching to construct a computational friendly preconditioner. This preconditioner improves the convergence speed of iterative solvers applied to the original problem, maintaining accuracy in the full space. Furthermore, the convergence rate of the solver improves at least linearly with the sketch size. Despite its potential, developing a sketch-and-precondition framework for randomized algorithms in low-rank matrix approximation remains an open challenge. We introduce the *Error-Powered Sketched Inverse Iteration* (EPSI) Method via run sketched Newton iteration for the Lagrange form as a sketch-and-precondition variant for randomized low-rank approximation. Our method achieves theoretical guarantees, including a convergence rate that improves at least linearly with the sketch size.

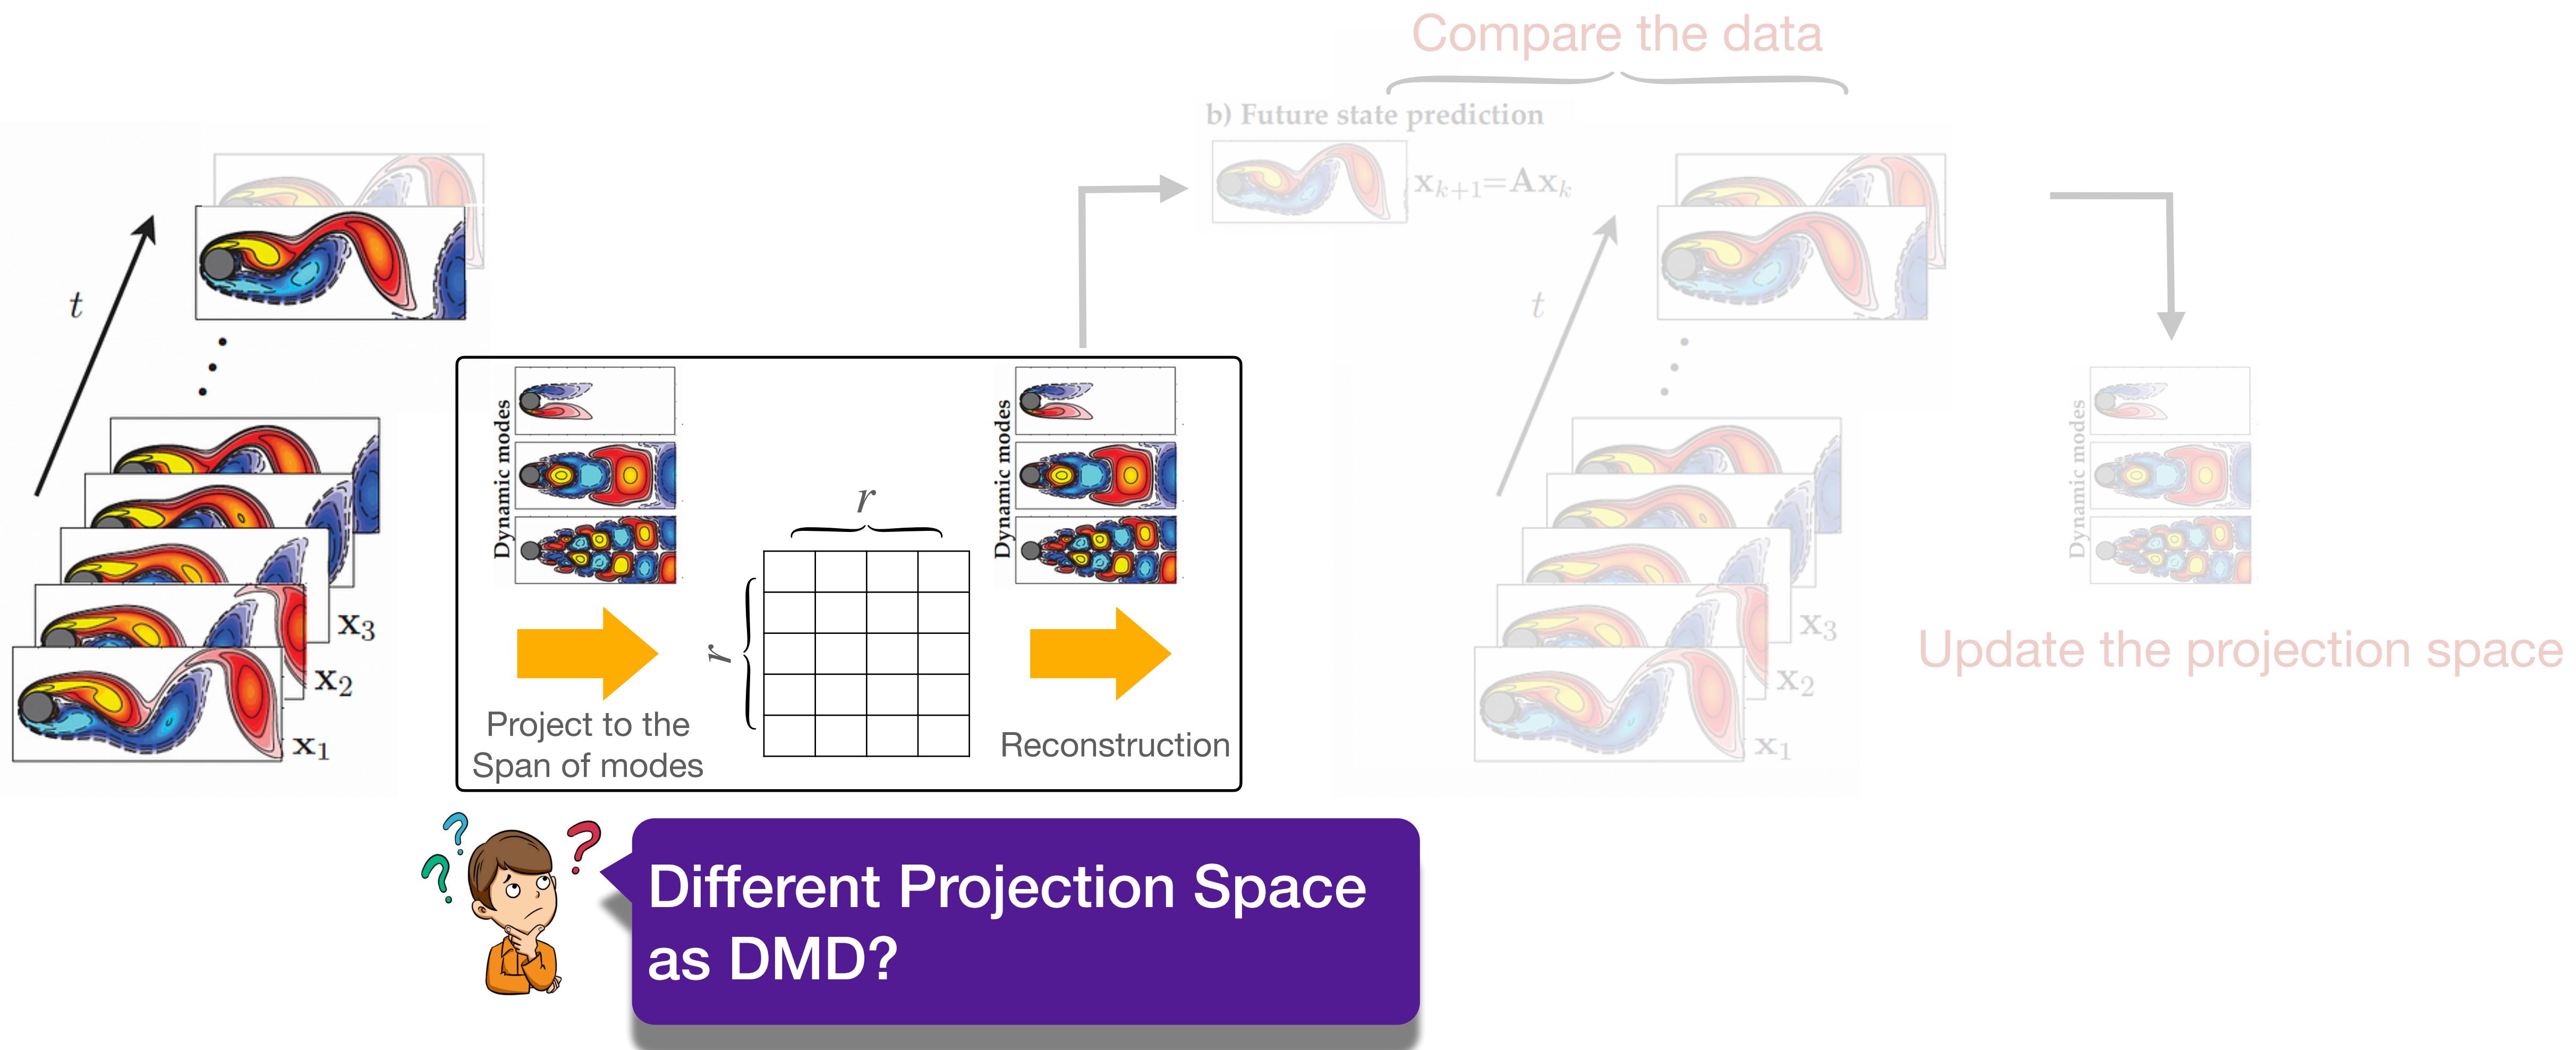

Another Supersing Fact...

Iteration lies in the Krylov Subspace

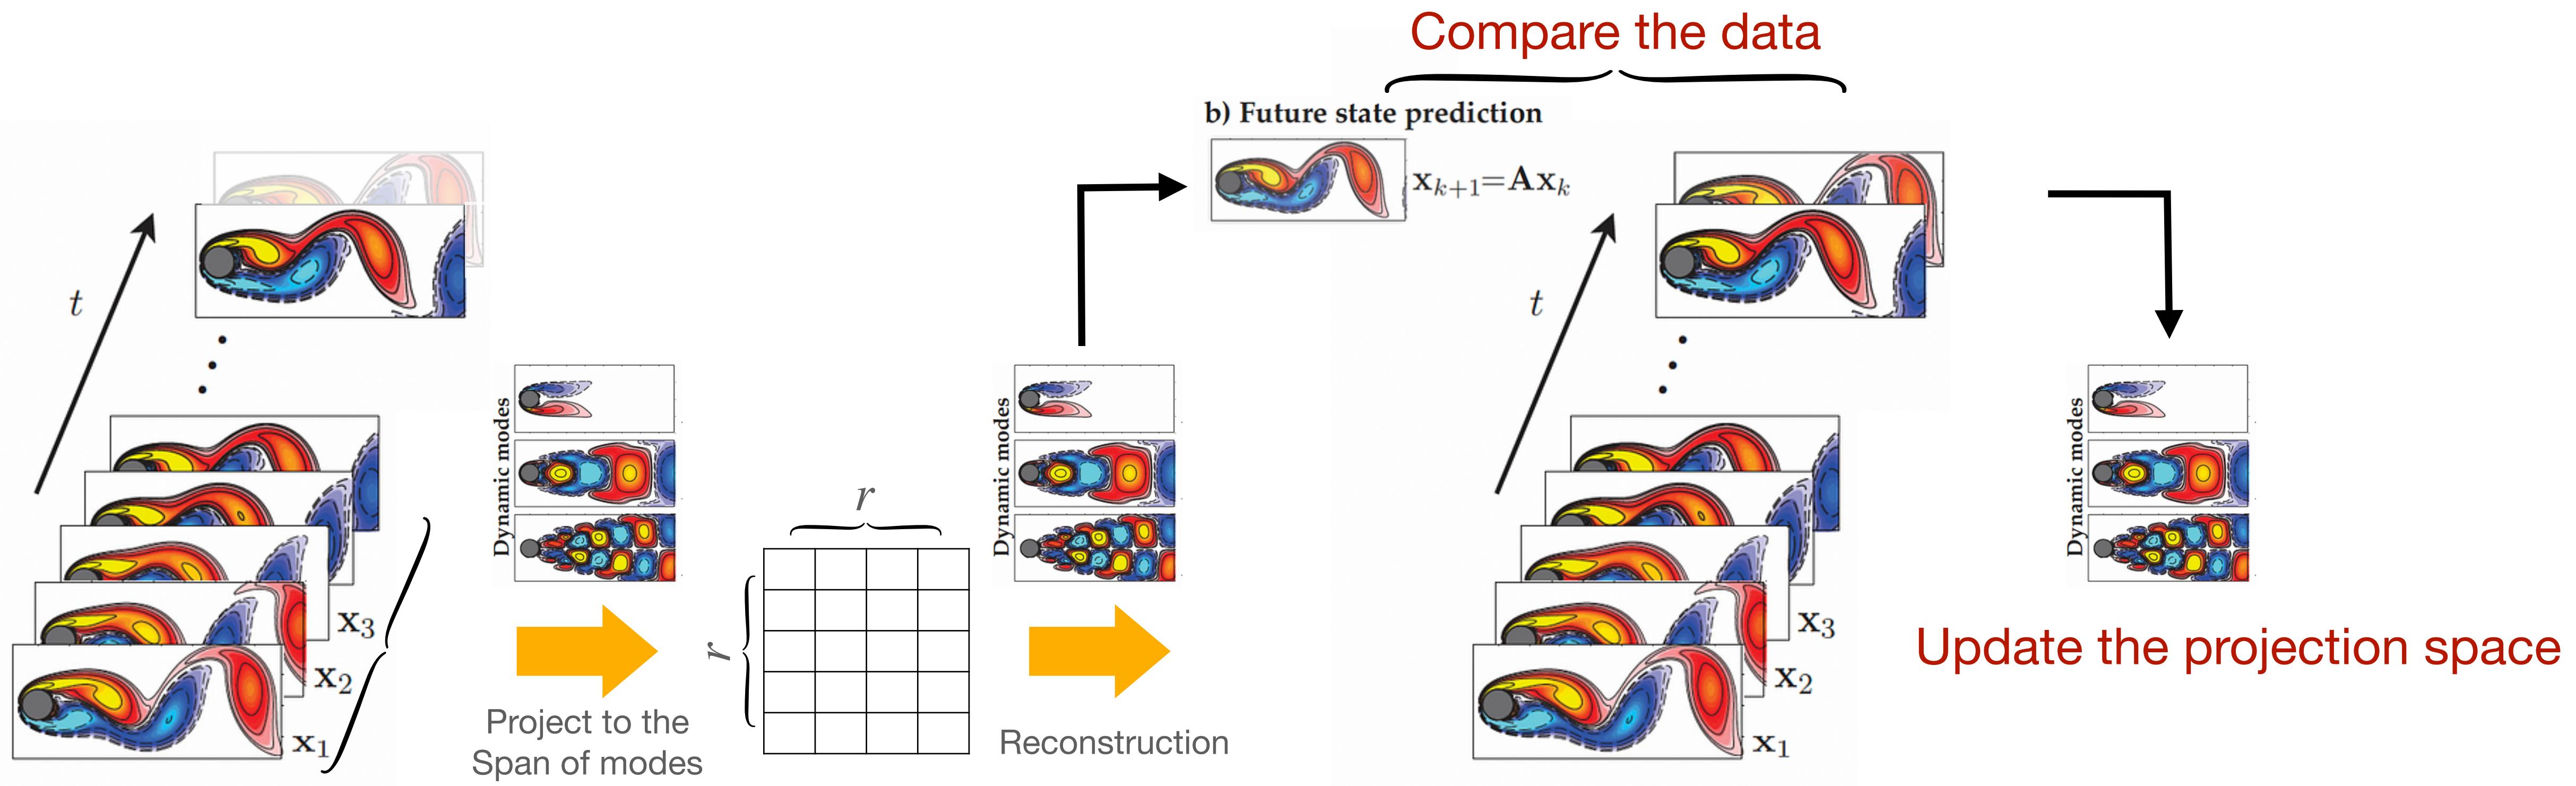

- enable dynamic mode decomposition
- Online fast update
- Much better than DMD

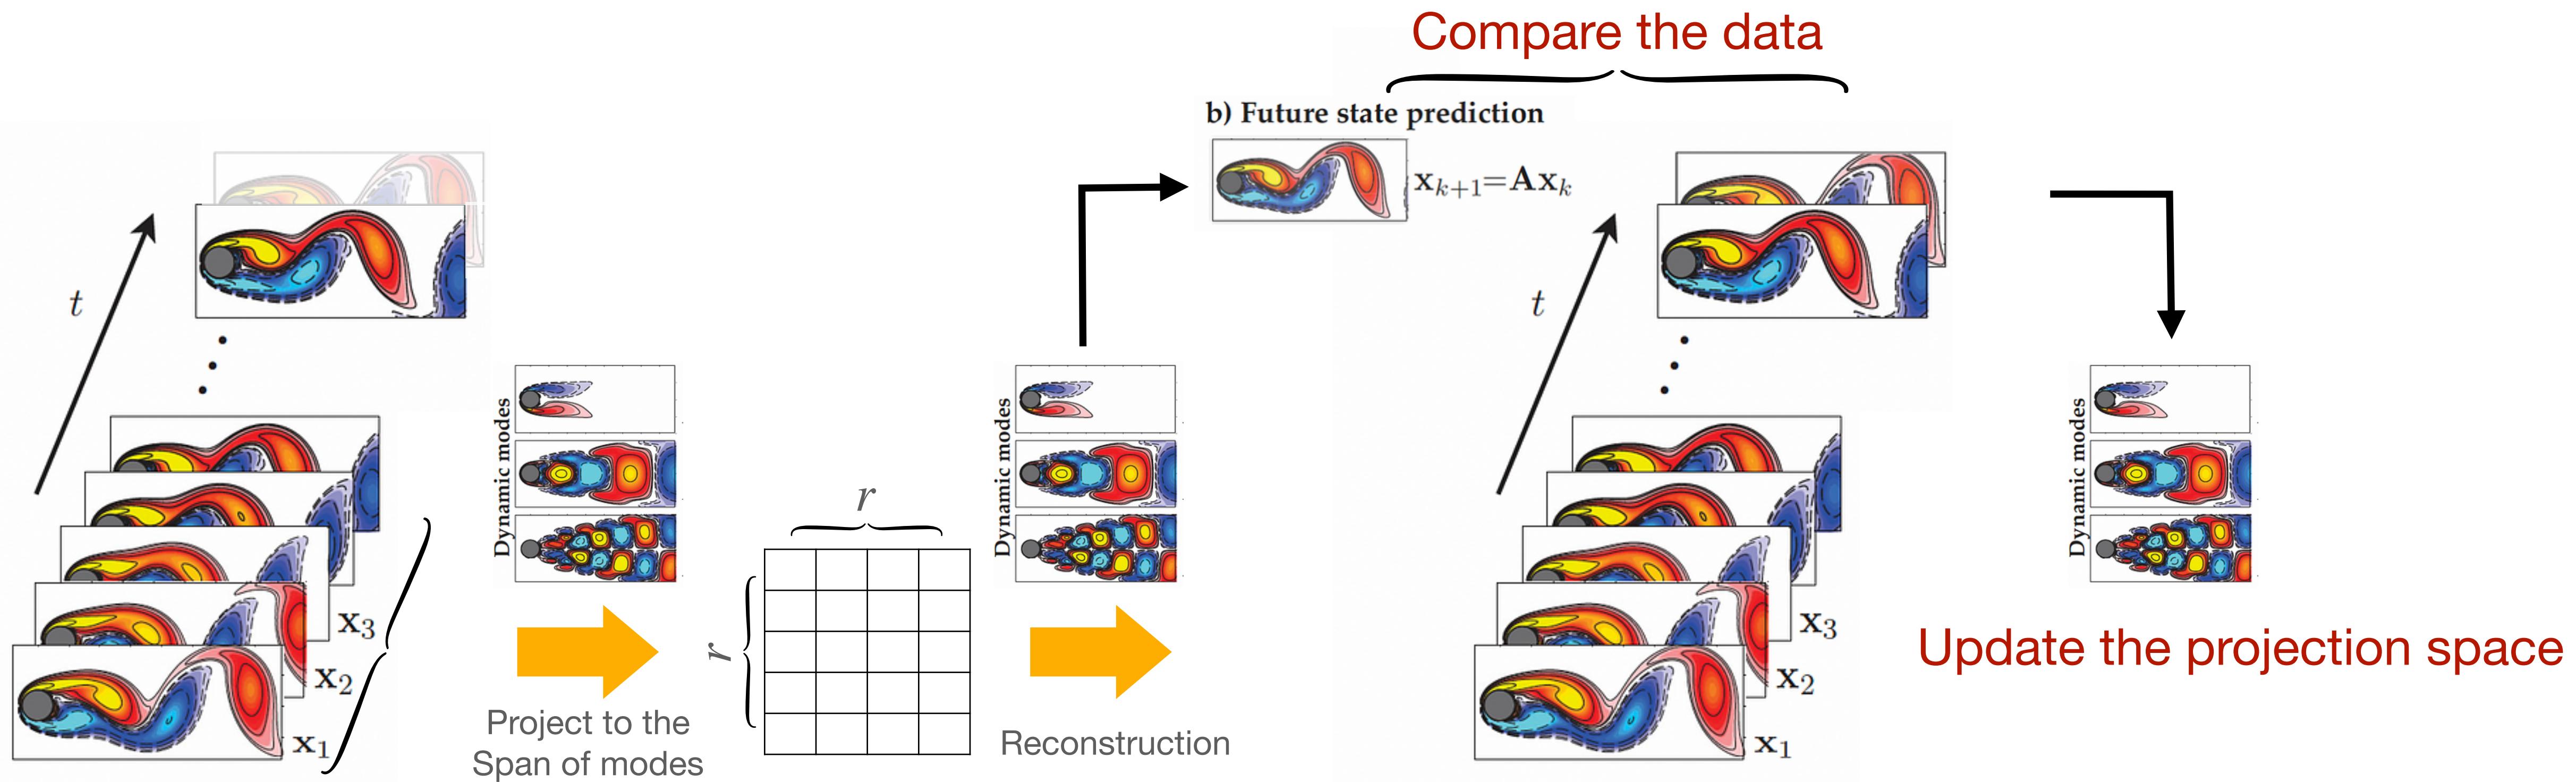

DMD with First-Order Feedback

DMD with First-Order Feedback

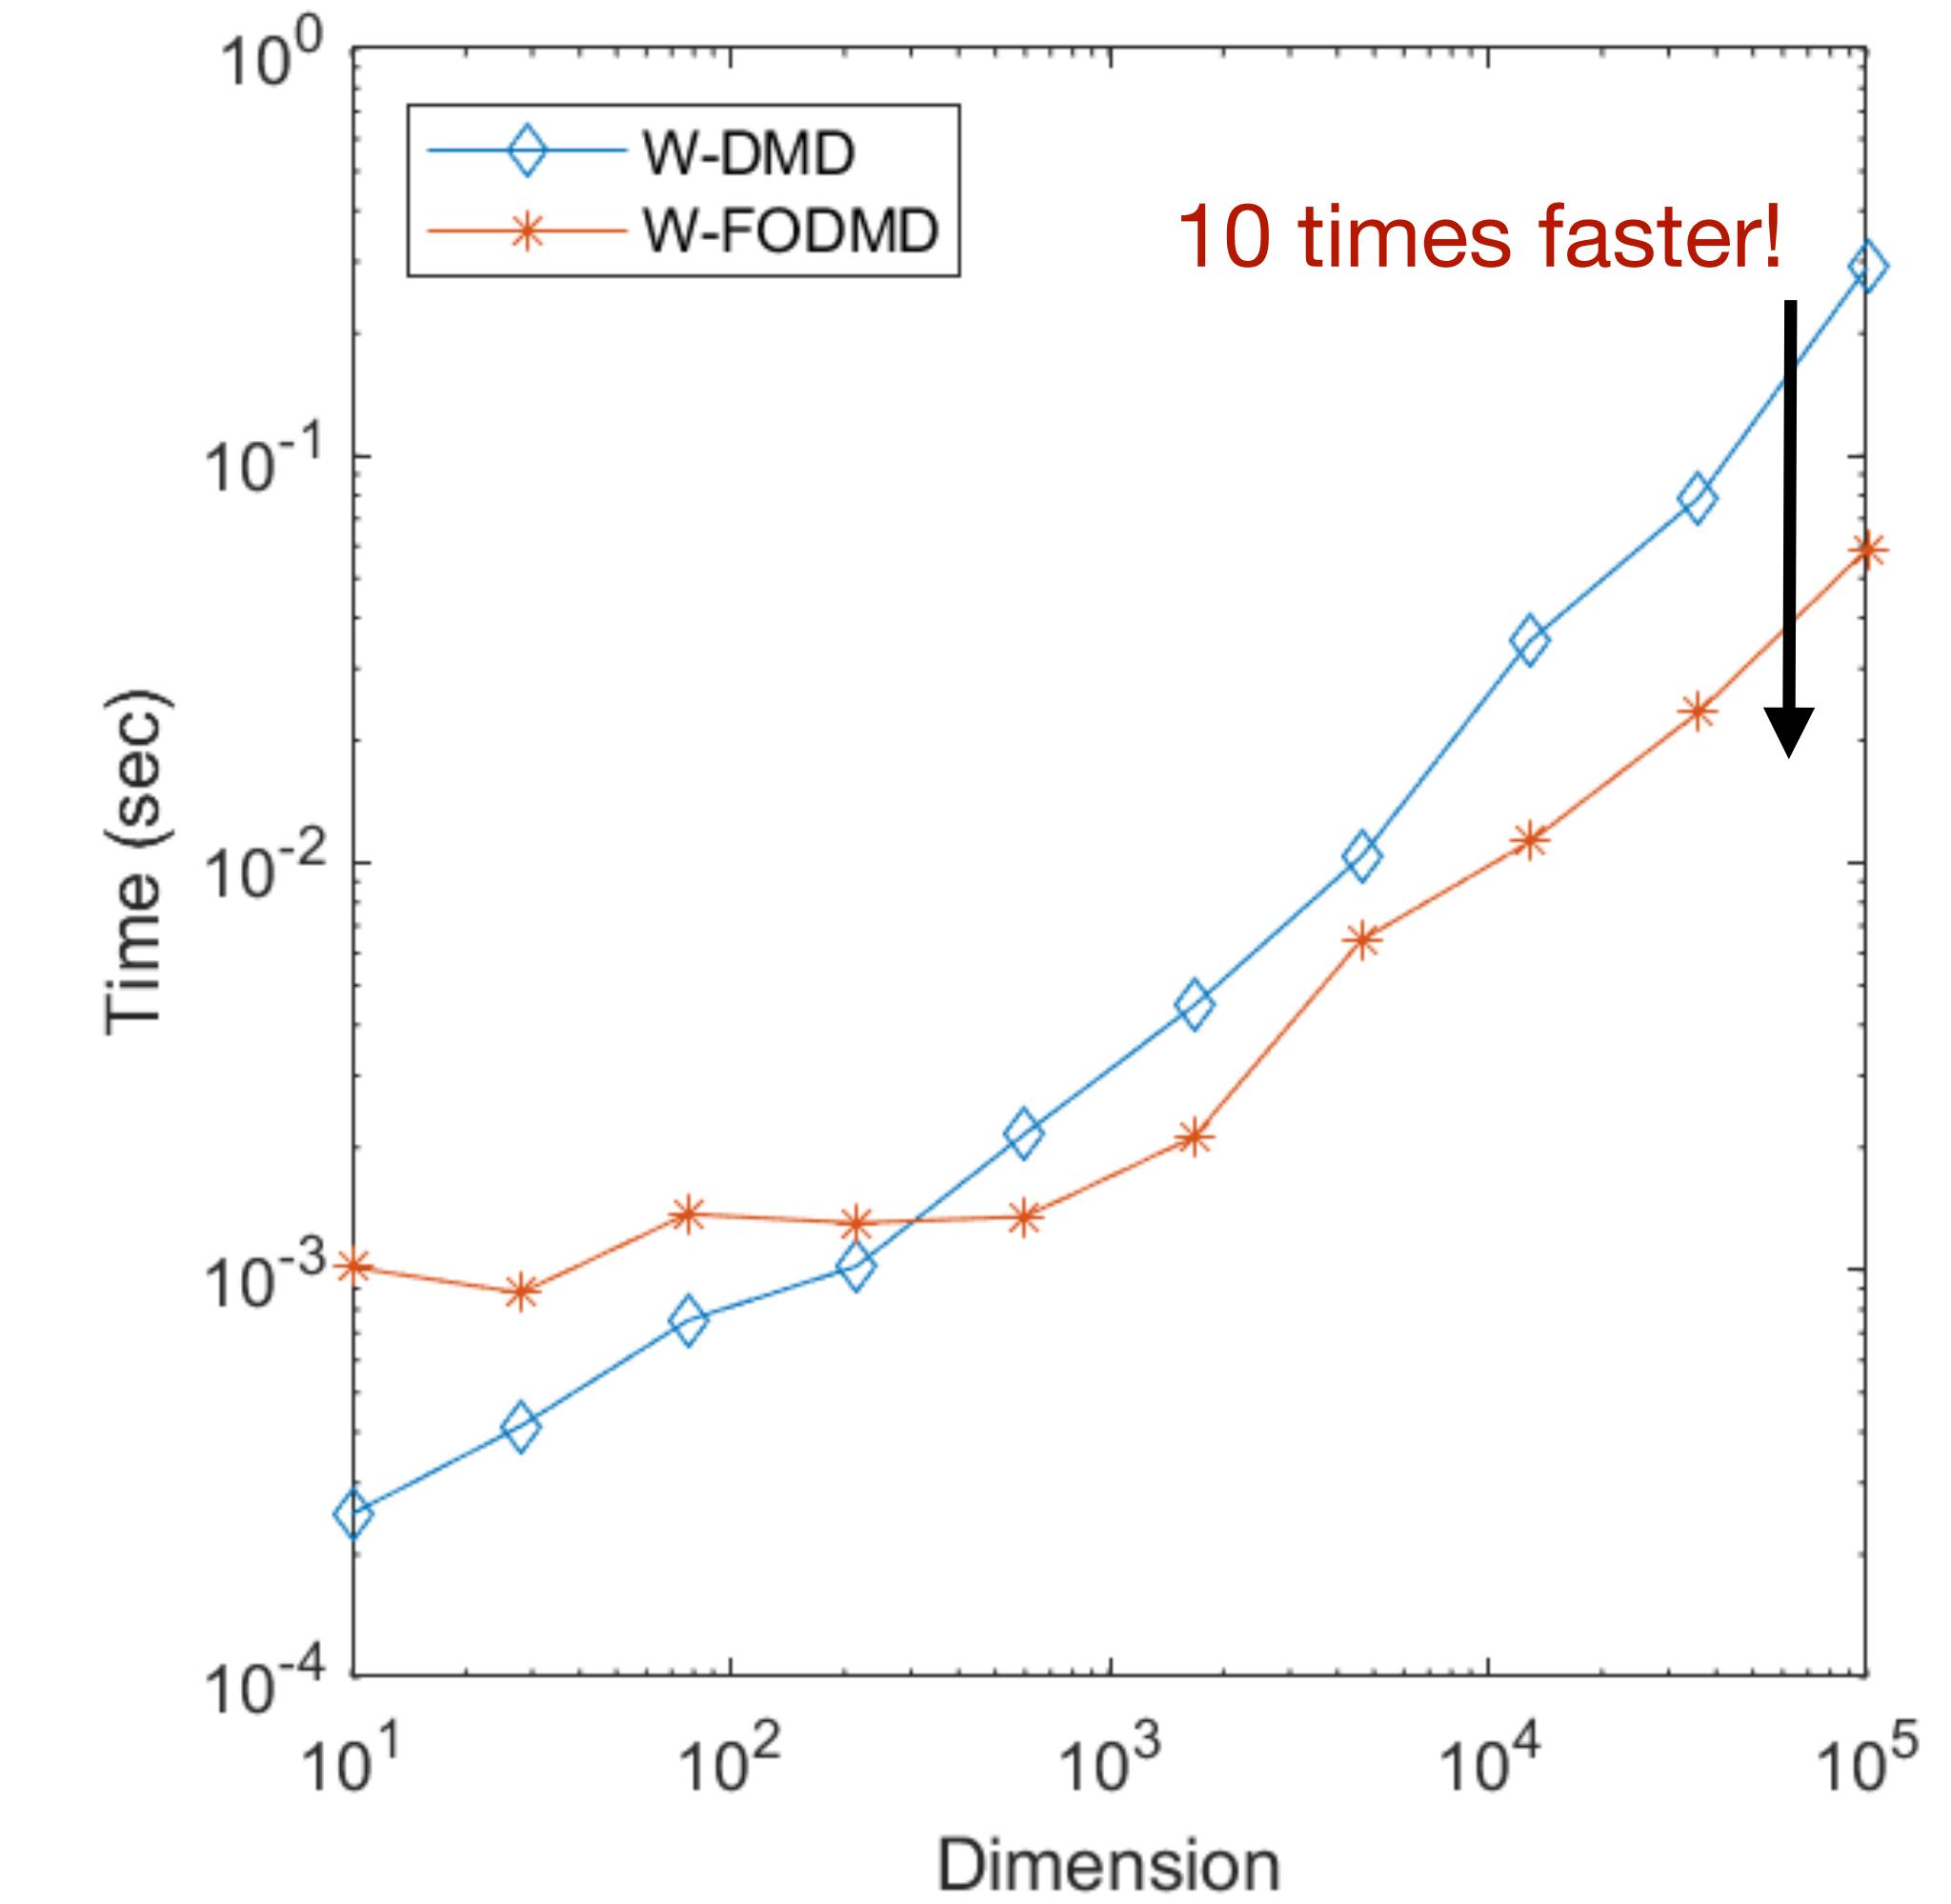

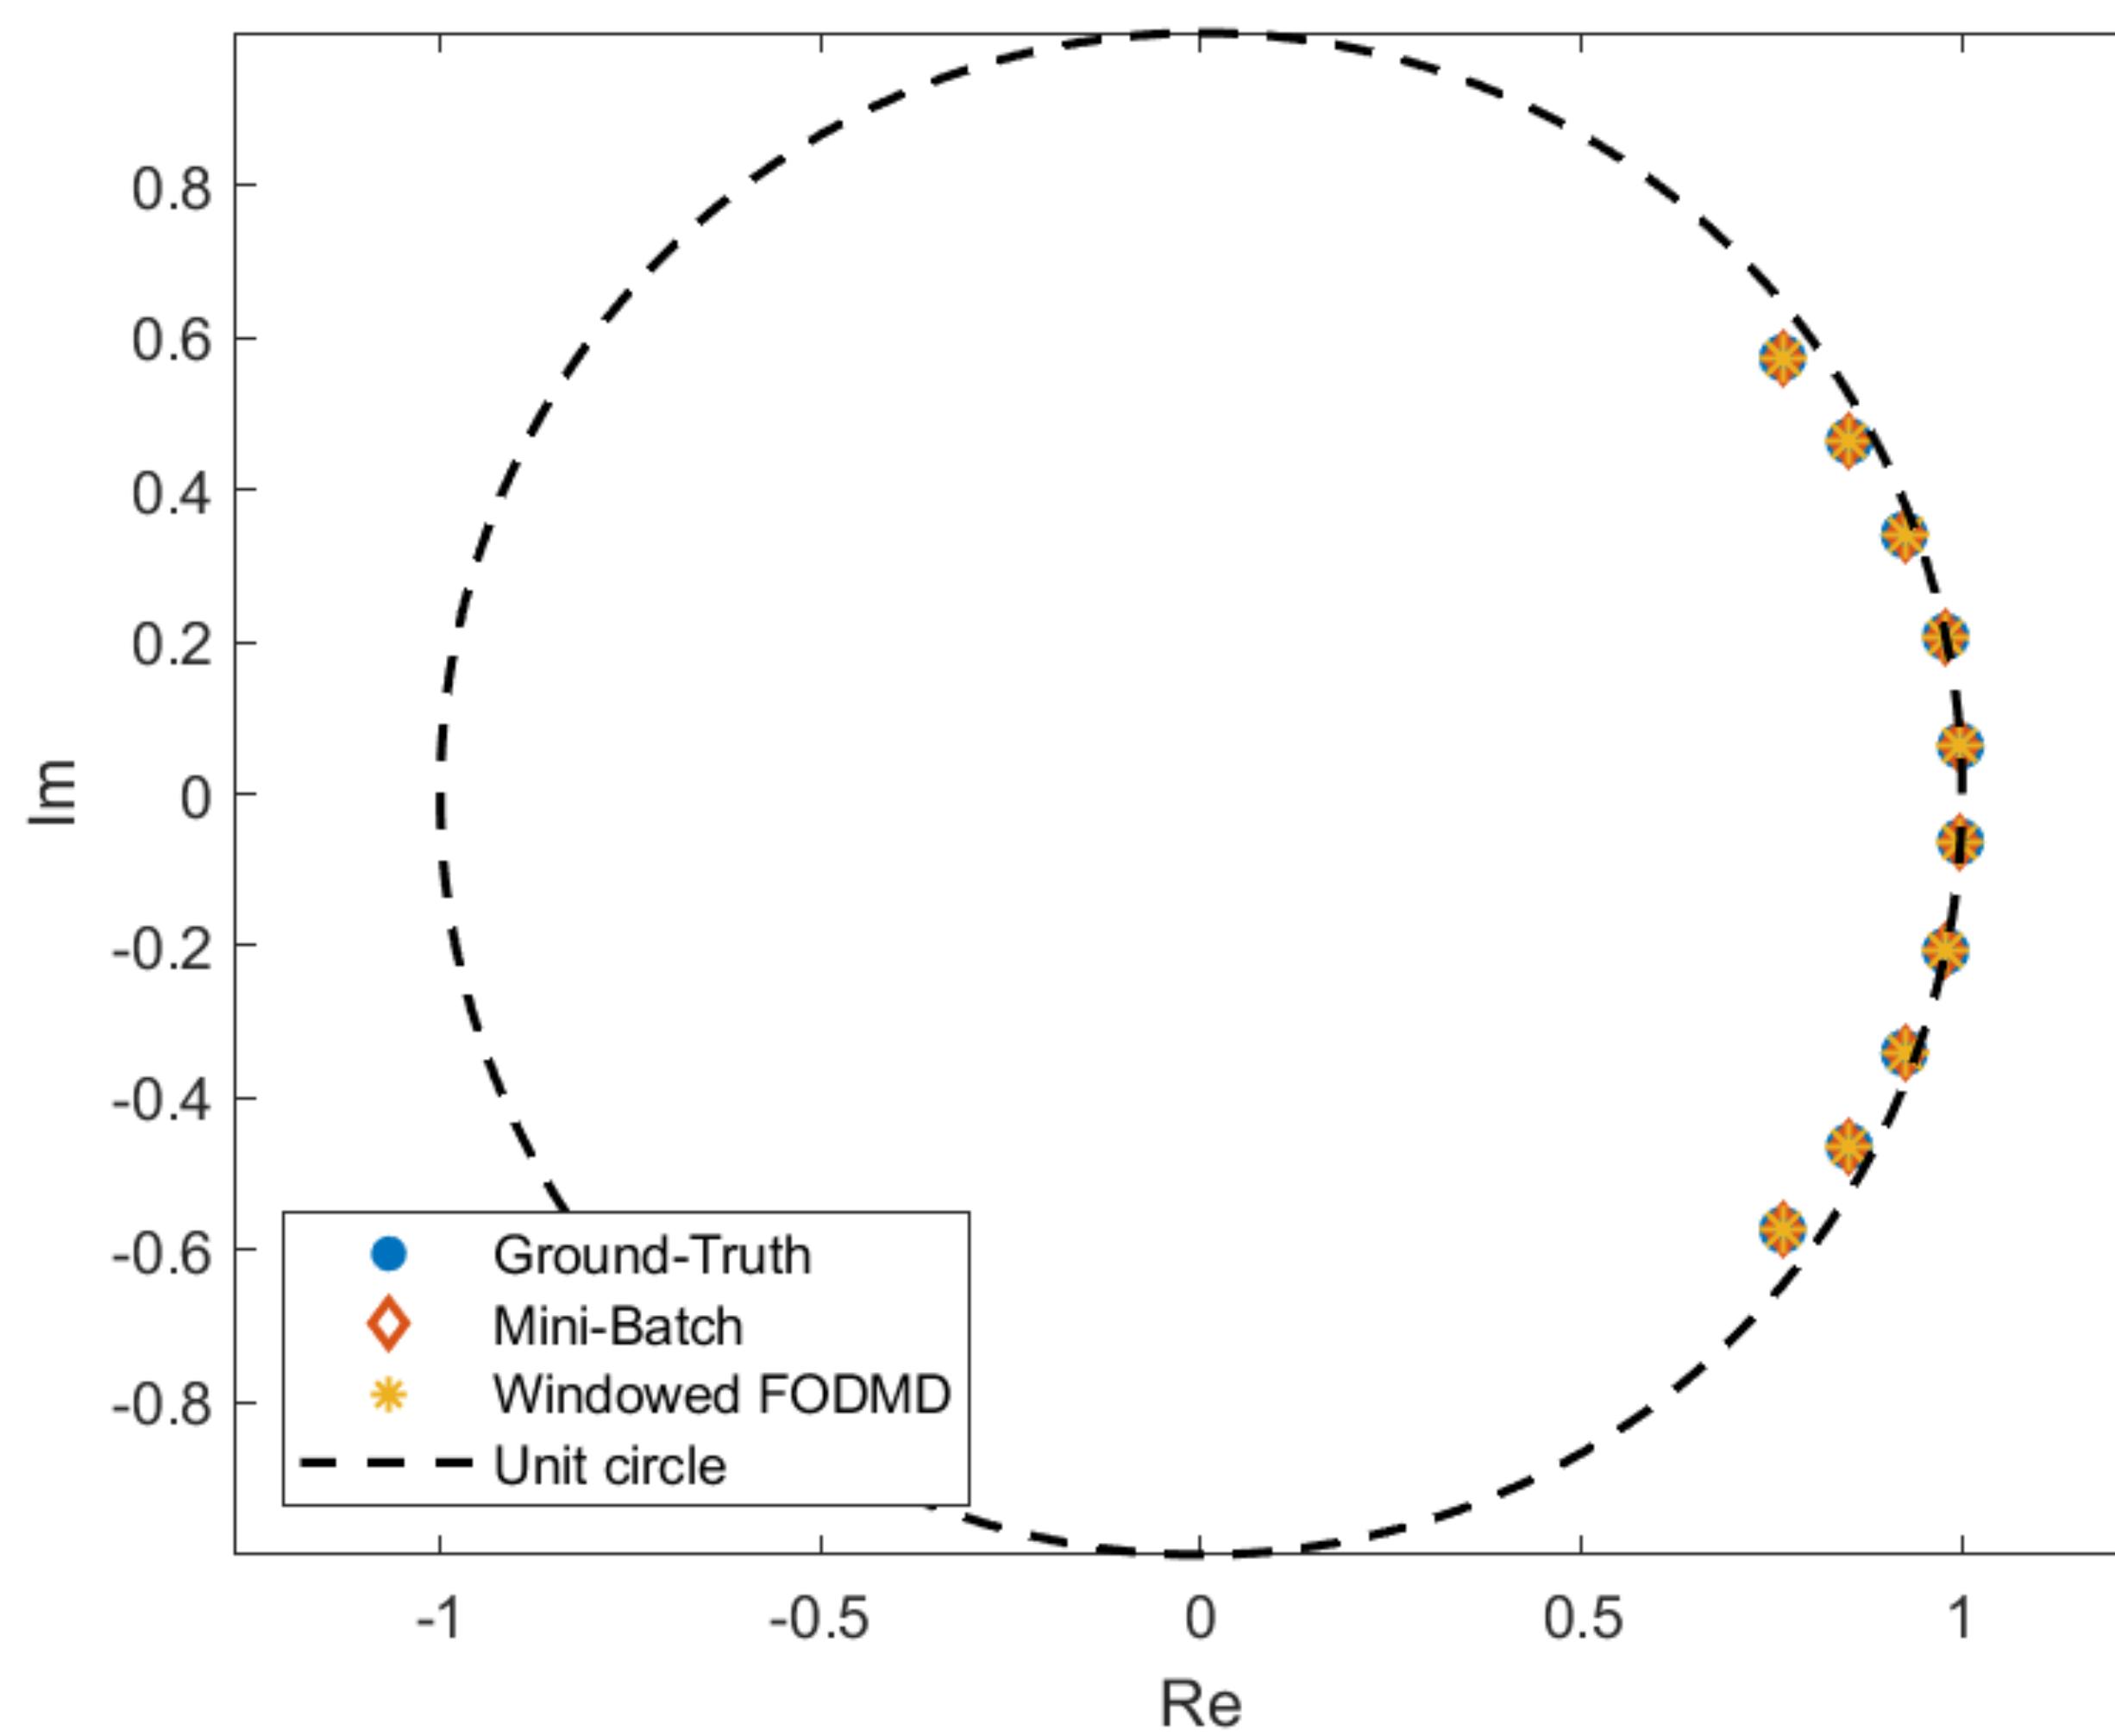

DMD with First-Order Feedback

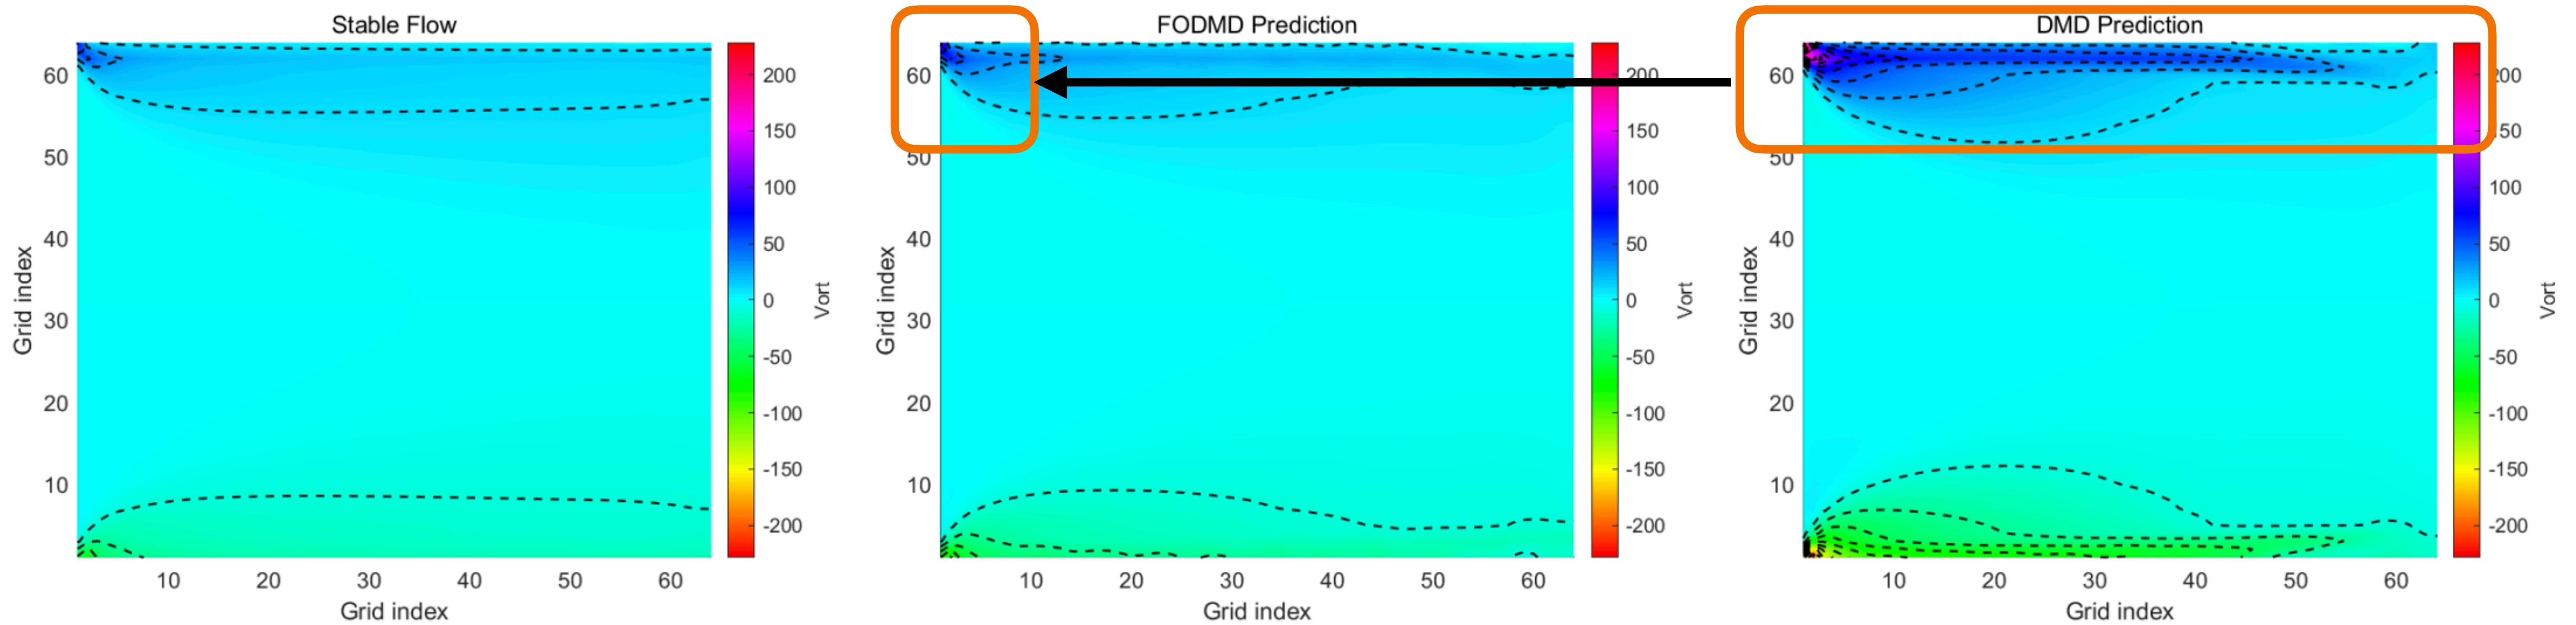

No matrix inverse, No SVD computation
Only a $n \times r$ QR decomposition
(Everything has a closed-form solution)

Faster than Recomputation!

Prediction of Tube Flow

One more thing...

Iterative
debiasing

Easier for numerical stability computation
Algorithms can do **online** computation

Newton
Methods

Easier for convergence analysis

Randomized Iterative Solver as Iterative Refinement A Simple Fix Towards Backward Stability

Ruihan Xu
University of Chicago

Yiping Lu
Northwestern University

Abstract

Iterative sketching and sketch-and-precondition are well-established randomized algorithms for solving large-scale over-determined linear least-squares problems. In this paper, we introduce a new perspective that interprets Iterative Sketching and Sketching-and-Precondition as forms of Iterative Refinement. We also examine the numerical stability of two distinct refinement strategies: iterative refinement and recursive refinement, which progressively improve

tive tools for developing approximate matrix factorizations. These methods are remarkable for their simplicity and efficiency, often producing surprisingly accurate results.

In this paper, we consider randomized algorithms to solve the overdetermined linear least-squares problem

$$x = \arg \min_{y \in \mathbb{R}^n} \|b - Ay\| \quad (A \in \mathbb{R}^{m \times n}, b \in \mathbb{R}^m) \quad (1)$$

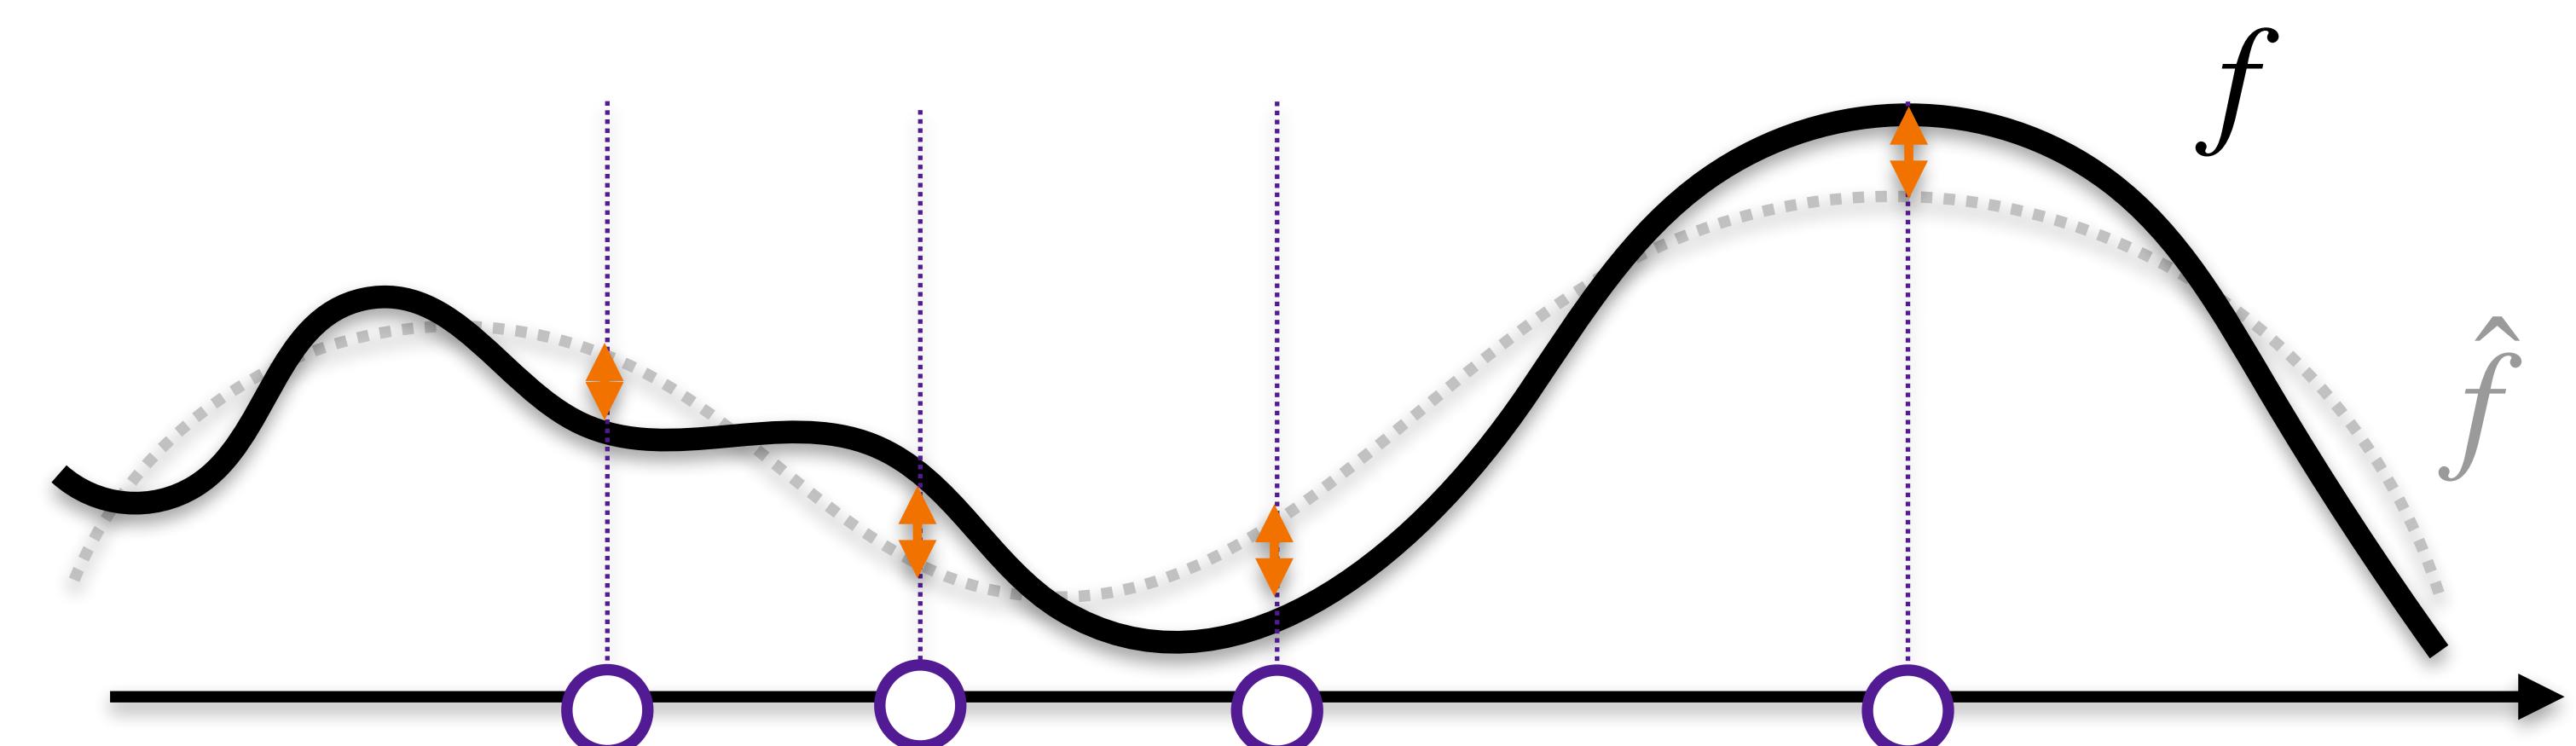

I What is SCaSML about?

$$\{X_1, \dots, X_n\} \sim \mathbb{P}_\theta \rightarrow \theta \rightarrow \Phi(\theta)$$

Step 1: Using Machine Learning to fit the rough function/environment

Step 2: Using validation dataset to know how much mistake machine learning algorithm has made

Step 3: Using Simulation algorithm to estimate $\Phi(\theta) - \Phi(\hat{\theta})$

Using ML surrogate during inference time to improve ML solution
