Vector and Matrix 1

Vectors

$$ec{a} = egin{bmatrix} A_x \ A_y \ A_z \end{bmatrix}, ec{b} = egin{bmatrix} B_x \ B_y \ B_z \end{bmatrix}$$

 $\begin{aligned} \text{Vector Addition:} \vec{a} + \vec{b} &= \begin{bmatrix} A_x + B_x \\ A_y + B_y \\ A_z + B_z \end{bmatrix} \\ \text{Vector Scalar Multiplication:} c\vec{A} &= \begin{bmatrix} cA_x \\ cA_y \\ cA_z \end{bmatrix} \end{aligned}$

Dot Product: $\vec{A} \cdot \vec{B} = A_x \cdot B_x + A_y \cdot B_y + A_z \cdot B_z$ (Dot Product is a linear combination, $\vec{A} \cdot \vec{B} = \vec{A}^{\top} \vec{B}$ in lecture 3)

Length: $\|\vec{A}\| = \sqrt{A_x^2 + A_y^2 + A_z^2}$

Angle Between Two Vectors: $\theta = \arccos\left(\frac{\vec{A} \cdot \vec{B}}{\parallel \vec{A} \parallel . \parallel \vec{B} \parallel}\right)$

Span by ChatGPT The "span" of a set of vectors is the set of all possible linear combinations of those vectors. In other words, it's the space formed by stretching, shrinking, or combining the vectors using scalar multiplication and addition. Geometrically, the span of vectors in 2D or 3D space forms a plane or a subspace. In higher-dimensional spaces, it forms a hyperplane or a subspace.

Matrix Examples see https://2prime.github.io/files/linear/matrixvector. pdf

Matrix $A \in \mathbb{R}^{m \times n}$ means m rows and n column matrix. Matrix A can be multiply with a vector v in \mathbb{R}^n

• Row Representation

$$A = \begin{bmatrix} r_1^\top \\ r_2^\top \\ \dots \\ r_m^\top \end{bmatrix}, r_i \in \mathbb{R}^n, Av = \begin{bmatrix} r_1 \cdot v \\ r_2 \cdot v \\ \dots \\ r_m \cdot v \end{bmatrix} = \begin{bmatrix} r_1^\top v \\ r_2^\top v \\ \dots \\ r_m^\top v \end{bmatrix}$$

• Column Representation

$$A = \begin{bmatrix} \vec{v}_1, \vec{v}_2, \cdots, \vec{v}_n \end{bmatrix}, \vec{v}_i \in \mathbb{R}^m, \vec{x} = \begin{bmatrix} x_1 \\ x_2 \\ \dots \\ x_n \end{bmatrix} A \vec{x} = \underbrace{x_1}_{\text{scalar vector}} + x_2 \vec{v}_2 + \dots + x_n \vec{v}_n$$

Linear Systems For a linear system

$$\begin{cases}
a_{11}x_1 + a_{12}x_2 + \dots + a_{1n}x_n = b_1 \\
a_{21}x_1 + a_{22}x_2 + \dots + a_{2n}x_n = b_2 \\
\dots \\
a_{m1}x_1 + a_{m2}x_2 + \dots + a_{mn}x_n = b_m
\end{cases}$$
(1)

We can understand it as

ullet a linear combiniation problem: if vector $\vec{b} = \begin{bmatrix} b_1 \\ b_2 \\ \dots \\ b_m \end{bmatrix}$ lies in the span of

$$\begin{bmatrix} a_{11} \\ a_{21} \\ \vdots \\ a_{m1} \end{bmatrix}, \begin{bmatrix} a_{12} \\ a_{22} \\ \vdots \\ a_{m2} \end{bmatrix}, \dots, \begin{bmatrix} a_{1n} \\ a_{2n} \\ \vdots \\ a_{mn} \end{bmatrix}$$

column vectors of matrix A

• a matrix equation $A\vec{x} = \vec{b}, \vec{x} = \begin{bmatrix} x_1 \\ x_2 \\ \dots \\ x_n \end{bmatrix}$ (n unknown), $\vec{b} = \begin{bmatrix} b_1 \\ b_2 \\ \dots \\ b_m \end{bmatrix}$ (right hand side of m equations)

$$A = \begin{bmatrix} a_{11} & a_{12} & \cdots & a_{1n} \\ a_{21} & a_{22} & \cdots & a_{2n} \\ \vdots & \vdots & \ddots & \vdots \\ a_{m1} & a_{m2} & \cdots & a_{mn} \end{bmatrix} \in \mathbb{R}^{m \times n}$$

Linear depedent and linear independent:

- $\vec{v}_1, \vec{v}_2, \dots, \vec{v}_n$ are linear depedent if there exists c_1, \dots, c_n which are not all zero such that $c_1\vec{v}_1 + c_2\vec{v}_2 + \dots + c_n\vec{v}_n = \vec{0}$
- $\vec{v}_1, \vec{v}_2, \dots, \vec{v}_n$ are linear indepedent if only $c_1 = c_2 = \dots = c_n = 0$ can make $c_1 \vec{v}_1 + c_2 \vec{v}_2 \dots + c_n \vec{v}_n = \vec{0}$

Linear system Ax = b (NOT Required! Only need to know what's the inverse and not all matrix have an inverse)

- A don't have an inverse:
 - have solution if and only if $b \in \text{span}\{\vec{v}_1, \dots, \vec{v}_n\}$ where $\vec{v}_1, \dots, \vec{v}_n$ are column vectors of matrix A
 - In this case A is not invertible, the linear system have 0 solutions or infinite solutions.
- have a unique solution if and only if matrix A have an inverse matrix A^{-1} . The unique solution is $x = A^{-1}b$. In this case, (*important*) A must be a square matrix and $\vec{v}_1, \dots, \vec{v}_n$ are linear independent.

2 Matrix Operations

 $A \in \mathbb{R}^{m \times n}, B \in \mathbb{R}^{n \times k}$ then $C = AB \in \mathbb{R}^{m \times k}$.

$$AB = \begin{bmatrix} \vec{r}_{1}^{\top} \\ \vdots \\ \vec{r}_{m}^{\top} \end{bmatrix} \begin{bmatrix} \vec{v}_{1}, & \cdots, & \vec{v}_{k} \end{bmatrix} = \begin{bmatrix} \vec{r}_{1}^{\top} \vec{v}_{1} & \vec{r}_{1}^{\top} \vec{v}_{2} & \cdots & \vec{r}_{1}^{\top} \vec{v}_{k} \\ \vdots & \vdots & \vdots & \vdots \\ \vec{r}_{m}^{\top} \end{bmatrix}$$
(2)

- (AB)C = A(BC), A(B+C) = AB + AC, c(AB) = A(cB)
- $AB \neq BA$
- $A[\vec{v}_1, \cdots, \vec{v}_k] = [A\vec{v}_1, \cdots, A\vec{v}_k]$

$$\bullet \begin{bmatrix} \vec{r}_1^\top \\ \vec{r}_2^\top \\ \dots \\ \vec{r}_k^\top \end{bmatrix} A = \begin{bmatrix} \vec{r}_1^\top A \\ \vec{r}_2^\top A \\ \dots \\ \vec{r}_k^\top A \end{bmatrix}$$

- $AI_n = A, I_m A = A$
- For a square matrix A, $AA^{-1} = A^{-1}A = I$
- $\bullet (AB)^{\top} = B^{\top}A^{\top}$
- A upper triangular matrix times a upper triangular matrix is a upper triangular matrix. A Lower triangular matrix times a lower triangular matrix is a upper triangular matrix.

3 Elimination

The Agumentation matrix of linear system Ax = b is [A|b]. Opertations you can choose to simplify the system:

- Scalar multiply a row
- Replace row (j) by **row(i) + row(j).
- switch two row

First Way Eliminate to Upper Triangular Form and then solve the upper triangular form.

Second Way (Easier to implement) These transformations provides equivalent systems.

Solving the equation equivalent to transform augmented matrix [A|b] to [I|x], we do it column by column

Example:

• Change the first column to
$$\begin{bmatrix} 1\\0\\0 \end{bmatrix}$$

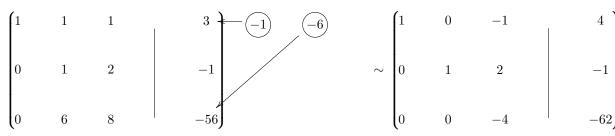

-2 means replace Row 2 by (-2) * Row 1 + Row 2

-20 means replace Row 3 by (-20) * Row 1 + Row 3

$$\begin{bmatrix} 1 & 1 & 1 & 1 & 3 \\ 2 & 4 & 6 & 4 & 4 & -2 \\ 20 & 26 & 28 & 4 & 4 & -56 \end{bmatrix} \times \begin{bmatrix} 1 & 1 & 1 & 1 & 3 \\ 0 & 2 & 4 & -2 \\ 0 & 6 & 8 & -56 \end{bmatrix} \times \begin{bmatrix} 1 & 1 & 1 & 3 \\ 0 & 1 & 2 & -1 \end{bmatrix}$$

• Change the second column to $\begin{bmatrix} 0 \\ 1 \\ 0 \end{bmatrix}$ by using the second row as **pivot**

-6 means replace Row 3 by (-6) * Row 2 + Row 3

• Change the third column to $\begin{bmatrix} 0 \\ 0 \\ 1 \end{bmatrix}$ by using the third row as **pivot**. do it by yourself

Elimination as Matrix Operation We can write the operations to change equivalent linear system by $[A|b] \rightarrow [E_{ji}A|E_{ji}b]$ and $[P_{ij}A|P_{ij}b]$.

- Elimination matrix E_{ji} : (be carefull about the index)
 - Replace row (j) by $*\times row(i) + row(j)$
 - Identity matrix except $a_{ii} = *$
- Permutation matrix P_{ij} :
 - Swtich Row (i) with Row (j)
 - Identity matrix except $a_{ij} = a_{ji} = 1, a_{ii} = a_{jj} = 0$

Solving Linear System

- \bullet The linear system have a single solution: n non-zero pivots
- The linear system have no solution: There exists a line is

$$[0, 0, 0 \cdots, 0 | x]$$

where $x \neq 0$

• The linear system have infinite solutions: all rows with $0, 0, 0, \dots, 0$, the right hand side is also 0 (*i.e.* $[0, 0, \dots, 0|0]$).

Matrix Inverse

- $AA^{-1} = A^{-1}A = I_n$
- ways to calculate the inverse matrix: change [A|I] to $[I|A^{-1}]$
- $(AB)^{-1} = B^{-1}A^{-1}$

- The inverse of a upper triangular matrix is a upper triangular matrix.
- $(A^{\top})^{-1} = (A^{-1})^{\top}$
- Inverse of a elimination matrix: change a_{ji} of E_{ji} to $-a_{ji}$
- Inverse of a permutation matrix: its transpose
- AB = AC doesn't mean B = C. (A, B, C are both matrices) This is true only when A is invertible

4 LU Decomposition

- LU decomposition: A = LU, L is a lower traingular matrix, U is a upper traingular matrix
 - LU decomposition can be derived from eliminate a linear system to a upper traingular form.
 - We can represent eliminate process using eliminate matrix E_{ij} : Replace row (i) by **row(i) + row (j)

 $\underbrace{E_{n,n-1}}_{\text{eliminate column }n-1 \text{ using row }n-1 \text{ eliminate column }n-2 \text{ using row }n-2}_{} \cdots$

$$\underbrace{E_{n,1}E_{n-1,1}\cdots E_{2,1}}_{\text{eliminate column 1 using row 1}}A=U$$

 $-L^{-1}=(E_{n,n-1})(E_{n,n-2}E_{n-1,n-2})\cdots(E_{n,1}E_{n-1,1}\cdots E_{2,1})$ is the elimination process and U is the upper traingular form

- Example for 3×3 : https://2prime.github.io/files/linear/LU.pdf
- Using LU Decomposition to solve linear system Ax = b. We can change the equation to $L\underbrace{Ux}_{x} = b$
 - * Solve the lower triangular system Ly = b (one by one from top to bottom)
 - * Solve the upper traingular system Ux = y (one by one from bottom to top)
- LDU decomposition: A = LDU, L is a lower traingular matrix with all 1 diagonal elements, D is a diagonal matrix, U is a upper traingular matrix with all 1 diagonal elements
- LDL decomposition If A is symmetric, $A = LDL^{\top}$

- A is symmetric matrix means $A = A^{\top}$ ($a_{ij} = a_{ji}$, A is symmetric according to the diagonal)
- A is symmetric then A^{-1} is symmetric
- $-A^{T}A$ and $A^{T}A$ are symmetric square matrix even if A is not square.

5 Vector Space

- Vector space V means if $v_1, \dots, v_n \in V$ then all linear combinition of them $c_1v_1 + \dots + c_nv_n \in V$ also lies in V. (This should holds for all c_1, \dots, c_n) (checking VS1-VS8 only needed for problem set)
- $\{x|Ax=0\}$ (Null space) is a vector space, $\{x|Ax=b\}$ $(b\neq 0)$ is not a vector space
- a vector space is a line/plane/...(generalization of line and plane) that go through the origin

 $\{x|\text{condition}\}$ means all the possible x satisfies the condition

• Col(A) := $\{Ax|x \in \mathbb{R}^n\}$ = span $(\vec{v}_1, \dots, \vec{v}_n)$ (:= $\{x|c_1\vec{v}_1 + \dots + c_n\vec{v}_n\}$) (:= means definition) is a vector space

 $\{Ax|x\in\mathbb{R}^n\}$ means $\{b|b=Ax,x\in\mathbb{R}^n\}$, i.e. all the possible b that can be represented as Ax

Complete Solutions = Special Solution + element in the null space **Row Echelon Form**

- All nonzero rows are above any rows of all zeros.
- The leading entry of each nonzero row (pivot) occurs to the right of the pivot of the previous row.

Additional properties

- free **columns** \in span {pivot columns}
- pivot columns are linear indepedent.

Rank

- \bullet Rank r is number of pivots means the true size of the matrix
- $r \leq m, r \leq n$
- Number of free Varibale: n-r
- full row rank: r = m means column space is \mathbb{R}^m . So a linear system have at least one solution.
- full column rank: r = n means no free variable, which means null space is $\{\vec{0}\}$. So linear system have at most one solution

• m < n means r < n (because $r \le m$), n < m means r < n (because $r \le n$)

The four possibilities for linear equations depend on the rank r:

Basis: A basis of a vector space is a set of vectors in the subspace that are linearly independent and span the entire vector space

Dimension: The dimension of a subspace is the number of vectors in every basis for the subspace

Four Subspaces

- elimination will not change the row space but will change the column space
- elimination will not change the null space
- $\dim(\operatorname{Col}(A)) = \dim(\operatorname{Row}(A)) = \dim(\operatorname{Col}(A^{\top})) = \dim(\operatorname{Row}(A^{\top})) = \operatorname{rank}(A)$
- $\dim(\operatorname{Nul}(A)) = \mathbf{n} \operatorname{rank}(A), \dim(\operatorname{Nul}(A^{\top})) = \mathbf{m} \operatorname{rank}(A)$

How to calculate the four subspaces

- Row Space: Reduce to REF and pivot rows are the basis
- Column Space: $Col(A) = Row(A^{\top})$
- Null space Reduce to REF and find the free variable. Use pivot rows to solve the pivot variables.
